MEMORANDUM – RECEPTOR SELECTION

To: Pete Harmet, P.E., IDOT Bureau Chief of Programming
Illinois Department of Transportation

From: Tim Kelly, Huff & Huff, Inc.
Jamie Bents, Huff & Huff, Inc.

Date: October 31, 2013

Re: Traffic Noise and Noise Abatement Study
FAI 290 (Interstate 290), Eisenhower Expressway
IL Route 56 to Racine
Project Number: P-91-597-10
PTB Number: 157-001
Cook County, Illinois

The first step in assessing traffic noise is to select representative receptors. A noise receptor is an exterior area where frequent human use occurs, based on a review of aerial photography or site inspection. The noise receptors selected for the Eisenhower Expressway noise assessment were chosen based on site inspection to determine if exterior areas of frequent human use existed. Two hundred and ninety (290) receptor locations were identified as representative of existing and proposed conditions for the study area. These receptors are described herein and will be used for modeling. A receptor is typically representative of an area, a group, or cluster of noise sensitive receptors. The area, group, or cluster is referred to as a Common Noise Environment (CNE).

The project area, shown in Figure 1, is along Interstate 290 (I-290) from IL Route 56/Butterfield Road to Racine Avenue. The project area is within the Villages of Hillside, Westchester, Bellwood, Broadview, Maywood, Forest Park, Oak Park, and the City of Chicago. The proposed project is in two parts. Between the western terminus and Cicero Avenue, the widening of I-290 to four lanes in each direction is proposed, generally aligned along the existing roadway and improvements of the I-290 interchanges and bridges. From Cicero Avenue to the eastern terminus, the existing I-290 corridor is expected to be restriped to add a through lane; no bridges will be improved in the eastern half of this project.

1. Land Use

The surrounding land use is suburban and urban development. Table 1 lists the activity categories associated with the FHWA Noise Abatement Criteria (NAC), as referenced from the Illinois DOT Highway Traffic Noise Assessment Manual. This information was used to identify receptors in the project area.

TABLE 1

HOURLY WEIGHTED SOUND LEVEL

Activity Category	$L_{eq}(h)$	Evaluation Location	Description of Activity Category
A	57	Exterior	Lands on which serenity and quiet are of extraordinary significance and serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose.
B[1]	67	Exterior	Residential.
C[1]	67	Exterior	Active sport areas, amphitheaters, auditoriums, campgrounds, cemeteries, day care centers, hospitals, libraries, medical facilities, parks, picnic areas, places of worship, playgrounds, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, recreation areas, Section 4(f) sites, schools, television studios, trails and trail crossings.
D	52	Interior	Auditoriums, day care centers, hospitals, libraries, medical facilities, places of worship, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, schools, and television studios.
E[1]	72	Exterior	Hotels, motels, offices, restaurants/bars, and other developed lands, properties, or activities not included in A-D or F.
F	-	-	Agriculture, airports, bus yards, emergency services, industrial, logging, maintenance facilities, manufacturing, mining, rail yards, retail facilities, shipyards, utilities (water resources, water treatment, electrical), and warehousing.
G	-	-	Undeveloped lands that are not permitted.

[1] Includes undeveloped lands permitted for this activity category

No Activity Category A facilities were identified in the project area. The project area includes land uses within Activity Categories B (residences), C (churches, medical clinics/offices/laboratories, hospitals, health care centers, schools, day care centers, parks and recreation facilities, cemeteries, government/institutional buildings, colleges, veterinaries, a conservatory, a library, community centers, dance and yoga studios, and an events center), and E (hotel, restaurants, offices). These land uses have NAC as shown in Table 1.

Several Activity Category F land uses were identified near the project corridor. These uses include retail facilities, gas stations, and various industrial and commercial uses. Activity Category F uses have no established noise abatement criteria and do not need to be analyzed for noise impacts.

There are several areas in the project corridor that are Activity Category G, vacant or undeveloped

land. The majority of vacant land in the project area is located within the City of Chicago, between Central Avenue and Western Avenue. Activity Category G uses do not have established NAC, but traffic noise levels may be predicted for these uses during the traffic noise analysis.

Figure 2 (Sheets 1 through 21) depicts the existing land use along the project corridor.

2. Selected Noise Receptors

Receptor locations are selected to reflect changes in traffic noise levels as a result of changes in traffic volumes, speed, composition (trucks and cars), roadway alignment (horizontal and vertical), number of lanes, background noise, shielding, and ground cover. Distance to I-290 from the receptor was the main component used to select receptors for this project and was limited to receptors within 500 feet of the proposed improvements. The distance of 500 feet is based on FHWA's 2010 performance evaluation of the Traffic Noise Model (TNM) 2.5, the model that will be used to predict existing, no build, and build noise levels for the proposed project. The evaluation found that TNM is most accurate when used to assess receptors within 500 feet of the roadway, and that TNM under-predicted sound levels for "soft" ground types (turf) and over-predicted sound levels for "hard" ground types (pavement) for receptors farther than 500' from the roadway.[1] The closest receptor to the roadway within each CNE was selected, thereby representing the worst case traffic noise scenario for proposed conditions. For purposes of modeling and abatement concept evaluation, the CNE represents a collection of receptors with similar noise levels within a sensitive land use area.

Table 2 lists the receptor number, location, receptor type, and the approximate distance to the existing centerline. Figure 3 (Sheets 1 through 21) depict aerial photographs of each representative receptor and its corresponding CNE. The figure shows "primary" and "secondary" land use classifications used to identify the Land Use Activity Category for each area within the project corridor. This distinction was made because the land uses in the project area are urban and sometimes have multiple land uses within a single building. Buildings with more than one land use that could be represented by multiple Activity Categories were designated with "Primary" and "Secondary" land uses that identify which of the present land uses will be used to determine traffic noise impacts. For instance, a single building could contain a café with sidewalk seating on the first floor, with residential on the second floor (with an outdoor balcony), that could be considered either Activity Category B (residential) or E (restaurant). "Primary" land uses represent the most noise-sensitive land use in that building, and represent the land use category that will be used for traffic noise impacts determination. Per the previous example, residential land use/Activity Category B has a lower NAC (67 dB(A)) than restaurants/Activity Category E (72 dB(A)); therefore the "primary" land use category for that site would be Activity Category B (NAC of 67 dB(A)) so that the most noise-sensitive land use would be used to determine noise impacts. "Secondary" land uses are shown as a hatching over the "Primary" land use to indicate the other land use in the building that have NAC, but the NAC is higher than that of the primary land use. In the example given, Activity Category E (NAC of 72 dB(A)) would be the "secondary" land use.

Noise receptors were located using field investigations to determine exterior areas of frequent human use, such as balconies, benches, or other gathering places. Noise receptors may change or be added

1 U.S. Department of Transportation Research and Innovative Technology Administration. "Ground and Pavement Effects using FHWA's Traffic Noise Model 2.5." April 2010.

as the traffic noise analysis progresses, and additional site data is collected.

a/ due to many mixed-use buildings, the activity category listed is the most noise-sensitive use of the uses within that CNE.

b/ Land uses with NAC are listed; land uses without NAC are not included.

SFR denotes Single Family Residential

MFR denotes Multiple Family Residential

Section One: Introduction

This traffic noise analysis has been prepared to evaluate traffic noise for the Eisenhower Expressway (I-290) Reconstruction Project. The recommended improvement includes widening the I-290 mainline to four lanes in each direction; all of the mainline improvements will fit within the existing right-of-way (ROW) with some minor ROW needs occurring at several interchanges. The noise study area, shown in Figure 1, is in within the Villages of Hillside, Westchester, Bellwood, Broadview, Maywood, Forest Park, Oak Park, and the City of Chicago in Cook County, Illinois.

IDOT and FHWA require a noise abatement analysis for the Preferred Alternative. However, given the level of stakeholder interest in traffic noise, the project team also developed a traffic noise sensitivity analysis that compares the year 2040 traffic noise levels of the four build alternatives advanced for further evaluation.

Volume 1 of the traffic noise analysis for this project presented the Federal and state noise regulations, a discussion of noise sensitive receptors, field noise monitoring, a description of the noise analysis methodology, and the analysis of the existing and future No Build noise levels. This document, Volume 2 of the traffic noise analysis, will present a sensitivity noise analysis of the four Build alternatives carried forward for the project (Section 2), the traffic noise impacts of the Preliminary Preferred Alternative (Section 3), an analysis of traffic noise abatement for the impacted receptors identified for the Preliminary Preferred Alternative and a summary of barriers recommended for construction (Section 4), and an analysis of currently undeveloped lands within the Preliminary Preferred Alternative noise study area (Section 5). A discussion of construction noise considerations for the Preliminary Preferred Alternative (Section 6) will be completed in the final version of this report, and Conclusions are noted in Section 7.

Section 2: Build Alternatives Carried Forward Sensitivity Analysis

Build Alternatives Carried Forward Identification

The four I-290 Build alternatives carried forward share the same design; each alternative would add a mainline travel lane in each direction between 25th Avenue and Austin Boulevard resulting in four travel lanes in each direction, and would modify interchange designs between 25th Avenue and IL 50/Cicero Avenue. No additional through lanes are proposed from Central Avenue to Racine Avenue. The variation in alternatives is related to how each alternative manages roadway lanes; the alternatives each propose a different use for the inside lane in each travel direction, as described below:

- General Purpose Add-Lane (GP Add Lane) (The additional lane in each direction would be a typical highway lane with no use restrictions)
- High Occupancy Vehicle Lane (HOV 2+)

- High Occupancy Toll Lane (HOT 3+)
- High Occupancy Toll Lane, plus Toll all remaining lanes (HOT 3+ Toll)

For the 2040 conditions, mainline traffic composition data were obtained from the lead Phase 1 consultant. In the 2040 conditions, the average percentage of automobiles on the I-290 mainline is estimated to be between 93 percent and 96 percent, with medium and heavy trucks combined accounting for between 4 and 7 percent.

Posted speed limits were used for speed data inputs for the noise analysis to assume that traffic will travel at free flow speeds. Using posted speed limits for the analysis is a conservative approach, as current I-290 traffic has been observed to travel at lower speeds than posted speed limits due to traffic delay. Using the posted speed would yield higher noise level results than using travel speeds of delayed traffic. The existing speed and proposed speed limit for I-290 is 55 mph. All existing speed limits on other roads were projected to remain the same in the future condition.

Noise Shielding from Potential Design Elements

The Eisenhower Expressway Preliminary Preferred Alternative may include design elements that may provide a degree of noise shielding. Public and agency project comments requested the inclusion of expanded width bridge decks for community connectivity across the expressway. These design elements may shield a portion of expressway noise from adjacent areas.

FHWA Traffic Noise Model 2.5 (TNM), the model used for the traffic noise analysis, does not have the capability to analyze noise shielding that may be provided by horizontal structures (such as expanded width bridge decks). The future build condition noise levels discussed are considered worst-case, and do not include any benefits from horizontal shielding from potential design elements.

Build Alternatives Carried Forward Sensitivity Analysis Findings

A traffic noise receptor is a discrete or representative location of a Common Noise Environment (CNE), which is an area of similar land use and noise characteristics. A representative receptor is location within a CNE that represents the worst-case noise level for all other individual represented receptors within that CNE. Traffic noise impacts are defined only for the Build condition, per IDOT policy, and include all representative receptors that would have noise levels that approach (- 1 dB(A)), meet, or exceed the NAC presented in Table 1.

Table 1 presents noise levels for the Existing, No Build, and four Build alternatives carried forward. Representative receptors indicating a noise impact in the Build condition are identified in Table 1 with boldface text. Figure 2 shows the analyzed representative receptors in the study area.

The Existing noise levels range from 57 dB(A) at R256 to 78 dB(A) at R100, R119, R172, R198, and R206. The projected No Build 2040 traffic noise levels range from 57 dB(A) at R256 to 79 dB(A) at R119 and R172. Noise levels either remain the same or increase up to 3 dB(A) from the

Existing condition to the 2040 No Build condition; the majority of representative receptors have no change or a 1 dB(A) increase in noise from Existing to 2040 No Build.

The projected Build 2040 traffic noise levels for the four Build alternatives are typically within the same range at each representative receptor. The four Build alternatives share the same design, but have different traffic volumes due to of the effects of managed lanes and tolling. The traffic volume differences influenced the slight differences in noise levels among the Build alternatives. The collective Build 2040 traffic noise levels range from 57 dB(A) at R256 to 79 dB(A) at R44, R100, R101, and R119. Typically, the four Build alternatives carried forward have similar noise levels to the 2040 No Build condition, with several representative receptors experiencing noise increases as much as 2 dB(A) from the 2040 No Build condition.

Boldface indicates the noise levels approach (- 1 dB(A)), meet, or exceed the NAC[1] in the ***future build condition***, constituting a ***noise impact.***

Observations and Conclusions

As noted in Table 1, there are no significant differences in noise levels for the four Build alternatives carried forward. Table 2 summarizes the number of representative receptors that would exceed the NAC for each alternative. Although the HOT 3+ Toll alternative has the fewest representative receptors exceeding the NAC, its noise levels are within 1 dB(A) of the other Build alternatives, which is not a perceptible change in noise.

[1] Please reference Volume 1 of the Traffic Noise Analysis for the FHWA NAC table.

TABLE 2
TRAFFIC NOISE IMPACTS SUMMARY BY BUILD ALTERNATIVE

	GP Add Lane (2040) Alternative	HOV 2+ (2040) Alternative	HOT 3+ (2040) Alternative	HOT 3+ Toll (2040) Alternative
Representative Receptors with Traffic Noise Impacts	230	228	229	220

Table 3 further illustrates there are no significant differences among traffic noise levels for the 2040 No Build and the four Build alternatives. The relative noise level changes from the 2040 No Build Condition to the 2040 Build Condition are reported in Table 3 both by the change in decibels and a description of how the human ear would perceive that level of noise change. Commonly accepted principles regarding perception of noise level changes, as cited in the IDOT Highway Traffic Noise Assessment Manual, include:

± 10 dB(A) a doubling or halving of perceived noise level

± 5 dB(A) readily perceptible change

± 3 dB(A) barely perceptible change

± 1 dB(A) less than barely perceptible change

TABLE 3
RECEPTORS WITH PERCEPTABLE NOISE CHANGE
NO BUILD TO BUILD CONDITIONS

Noise Level Perception	dB(A)	GP Add Lane	HOV 2+	HOT 3+	HOT 3+ Toll
Readily Perceptible	**>= +5**	0	0	0	0
Barely Perceptible	**>= +3**	1	1	1	1
Less than Barely Perceptible	**2 to -2**	284	283	284	284
Barely Perceptible	**<= -3**	2	3	2	2
Readily Perceptible	**<= -5**	1	1	1	1
	Total	288	288	288	288

The table indicates that noise levels of the year 2040 Build alternatives would generally be perceived by the human ear similarly to those of the year 2040 No Build alternative. The Build alternatives would minimally influence noise levels compared to the No Build condition, with between 98% and 99% of the representative receptors experiencing either no change or a change that is considered imperceptible (less than barely perceptible) to the human ear. Furthermore, none of the four Build alternatives would result in a readily perceptible increase in noise, and one representative receptor would experience a readily perceptible decrease in noise levels from the No Build condition.

The analysis indicates that a majority of the corridor, regardless of the Build alternative, would experience noise levels greater than the NAC, and would require a noise abatement analysis.

Section 3: Traffic Noise Impacts of the Preliminary Preferred Alternative

Preliminary Preferred Alternative Identification

The Preliminary Preferred Alternative for the I-290 Reconstruction Project is the HOT 3+ alternative, one of the Alternatives Carried Forward. The Preliminary Preferred Alternative has been refined to reflect continuous access to the proposed managed lane, updated traffic forecasts, and corresponding updated traffic volumes.

Preliminary Preferred Alternative Traffic Noise Impacts

Existing, 2040 No Build, and 2040 Build traffic noise levels for the 288 representative receptors associated with the Preliminary Preferred Alternative are shown in Table 4 below.

Observations and Conclusions

The 2040 traffic noise levels for the Preliminary Preferred Alternative as predicted by TNM range from 58 dB(A) at R256 to 79 dB(A) at R172 and R198. Noise level change from the No Build condition to the Preliminary Preferred Alternative condition ranges from -8 to 3 dB(A). Build traffic noise levels were found to decrease from the No Build condition for several representative receptors. This occurs due to roadway geometry changes in the western half of the corridor from 25th Avenue to Cicero Avenue (primarily due to interchange reconfigurations, I-290 lane shifts, and elevation modifications), as well as predicted slight traffic volume reductions in select areas of the eastern half of the corridor.

The lower elevation of I-290 relative to the representative receptors influenced noise levels; areas in a "trench" (such as in Forest Park and Oak Park) or other areas where I-290 is at a lower elevation than the surrounding land uses typically had lower noise levels than areas at nearly the same elevation as I-290. The "trench" provides some noise shielding to the surrounding representative receptors. In the Build condition, much of I-290 through Forest Park and Oak Park will be at a lower elevation than in existing conditions, which contributes to lower noise levels in some areas.

For the 2040 Preliminary Preferred Alternative, 228 of the 288 (79 percent) representative receptor locations approach, meet, or exceed the FHWA NAC, and therefore warrant a noise abatement analysis. None of the representative receptors are considered impacted due to a substantial increase (greater than 14 dB(A) increase) in traffic noise levels.

Individual traffic noise findings that deviate slightly from other trends in the corridor include:

- At R34, the proposed interchange geometry change at 25th Avenue (from a partial cloverleaf interchange to a single point urban interchange (SPUI)) is reflected in the noise results. In the existing and 2040 No Build conditions, Harrison Street west of 25th Avenue (north of I-290) carries local traffic and traffic for the 25th Avenue interchange westbound on ramp. In the Build condition, the westbound on ramp traffic is rerouted from Harrison Street to the new SPUI interchange ramp. As a result, there is less traffic on the frontage road west of 25th Avenue, resulting in 2040 Build traffic noise levels that are as much as 8 decibels lower that of the 2040 No Build (R34). R35, R32, and R33 also are influenced by the proposed Build 25th Avenue interchange design.
- At R76 and R76A (representative receptors in the northwest quadrant of the IL 43/Harlem Avenue interchange), the existing and 2040 No Build traffic noise levels will be the same or greater than those of the 2040 Build alternatives. The 2040 Build noise levels decrease due to the addition of vertical retaining walls needed to support the proposed Harlem interchange ramps. These walls reduce the noise level of the mainline noise (the greatest noise source) that reaches the representative receptors.
- Due to the proposed lower I-290 mainline elevation through Oak Park in combination with the proposed Harlem Avenue and Austin Boulevard interchange designs, additional shielding will be provided to representative receptors along the north side of I-290 through Oak Park, such as R79 (Wenonah Tot Lot, Oak Park, north side of I-290).

Section 4: Abatement Analysis

Abatement Alternatives

Traffic noise abatement measures were considered for the impacted representative receptors that approach, meet, or exceed the appropriate FHWA NAC. The most feasible approach to abating noise impacts in these areas would be to construct a noise barrier, which may include a noise wall, an earth berm, or a combination of both. Noise barriers placed adjacent to the roadway would attenuate traffic-related noise and are the most practical measure for this project. Noise abatement analysis is completed for all represented receptors within each CNE with an impacted representative (worst-case noise condition) receptor.[2] An effective noise barrier must be tall enough to break the line-of-sight between the receptor and source and typically extends beyond the last receptor four times the distance between the receptor and noise barrier. Noise barriers have a zone of effectiveness, or shadow zone, which is generally within 200 feet of the noise barrier; therefore, less noise reduction is achieved as the distance between the receptor and the noise barrier increases.

TNM was used to perform the noise barrier feasibility and reasonability evaluation for the impacted representative receptors. When determining if an abatement measure is feasible and reasonable, the noise reductions achieved, number of represented receptors benefited, total cost, and total cost per represented receptor benefited are considered.

Feasibility and Reasonableness

An analysis of noise abatement measures (noise barriers) was conducted in conformance with FHWA requirements contained in Title 23 Code of Federal Regulations Part 772 for each of the impacted representative receptors. In order for a noise abatement measure to be constructed, it must meet both the feasibility and reasonableness criteria, described below.

Feasibility

The feasibility evaluation is a combination of acoustical and engineering factors considered in the evaluation of a noise abatement measure. The acoustical portion of the IDOT policy, as required by FHWA regulations, considers noise abatement to be feasible if it achieves at least a 5 dB(A) traffic noise reduction at an impacted receptor. Factors including but not limited to safety, barrier height, topography, drainage, utilities, maintenance, and access issues also are considered.

Reasonableness

As per the FHWA regulations, a noise abatement measure is determined to be reasonable when all three of the following reasonableness evaluation factors are met:

- cost effectiveness of the highway traffic noise abatement measure;
- achievement of IDOT's noise reduction design goal; and,

[2] In the abatement analysis section of the report, all instances of "receptor," unless otherwise noted, are represented receptors.

- consideration of the viewpoints of the benefited receptors (property owners and residents) results in a majority desiring the abatement.

A noise abatement measure is considered cost-effective to construct if the noise wall construction cost per benefited receptor is less than the allowable cost per benefited receptor. A benefited receptor is any receptor that is afforded at least a 5 dB(A) traffic noise reduction from the proposed noise abatement measure. FHWA regulations allow each State Highway Authority to establish cost criteria for determining cost effectiveness.

IDOT policy establishes that the actual cost per benefited receptor shall be based on a noise wall cost of $25 per square foot, which includes engineering, materials, and construction. The base value allowable cost is $24,000 per benefited receptor, which can be increased based on three factors as summarized below:

- the absolute noise level of the benefited receptors in the design year build scenario before noise abatement;
- the incremental increase in noise level between the existing noise level at the benefited receptor and the predicted build noise level before noise abatement; and
- the date of development compared to the construction date of the highway. These factors are considered for all benefited receptors.

Absolute Noise Level Consideration

Predicted Build Noise Level Before Noise Abatement	Dollars Added to Base Value Cost per Benefited Receptor
Less than 70 dB(A)	$0
70 to 74 dB(A)	$1,000
75 to 79 dB(A)	$2,000
80 dB(A) or greater	$4,000

Source: IDOT Highway Traffic Noise Assessment Manual

Increase in Noise Level Consideration

Incremental Increase in Noise Level Between the Existing Noise Level and the Predicted Build Noise Level Before Noise Abatement	Dollars Added to Base Value Cost per Benefited Receptor
Less than 5 dB(A)	$0
5 to 9 dB(A)	$1,000
10 to 14 dB(A)	$2,000
15 dB(A) or greater	$4,000

Source: IDOT Highway Traffic Noise Assessment Manual

New Alignment / Construction Date Consideration

Project is on new alignment OR the receptor existed prior to the original construction of the highway	Dollars Added to Base Value Cost per Benefited Receptor
No for both	$0
Yes for either	$5,000

Note: No single optional reasonableness factor shall be used to determine that a noise abatement measure is unreasonable.
Source: IDOT Highway Traffic Noise Assessment Manual

The IDOT noise reduction design goal is to achieve an 8 dB(A) traffic noise reduction at a minimum of one benefited receptor. If a noise abatement measure is feasible, achieves the cost-effective criterion, and achieves the IDOT noise reduction design goal, then the viewpoints of benefited receptors are solicited, so they may vote regarding construction of the noise wall.

Noise Wall Analysis

TNM was used to perform the noise wall feasibility and reasonability check for the represented receptors in CNEs with a representative receptor impacted by the Preliminary Preferred Alternative. When determining if an abatement measure is feasible and reasonable, the noise reductions achieved, number of residences benefited, total barrier cost, total cost per residence benefited, and viewpoints of the benefited receptors are considered.

The noise wall analysis is reported in three sections.

- First, existing noise barriers (nine existing barriers are located between Butterfield Road and 25th Avenue and one barrier associated with the Jane Byrne Interchange that will soon be built between Loomis Street and Racine Avenue) and any recommended changes to those barriers are reported.
- Second, proposed new barriers are reported for the area from Butterfield Road to Cicero Avenue; this is an area proposed for complete I-290 reconstruction.
- Third, proposed new barriers are reported for the area from Cicero Avenue to Racine Avenue; this area is not proposed for reconstruction, but is proposed for I-290 restriping.

The noise barriers studied in the abatement analysis are shown in the Analyzed Noise Wall Location Map, Figure 2, found at the conclusion of the report.

Existing Noise Barriers

The project corridor contains nine existing noise walls from Butterfield Road to west of 25th Avenue (within the villages of Hillside, Westchester, and Bellwood), as well as one barrier that will soon be constructed as part of the Jane Byrne Interchange project between Loomis Street and Racine Avenue (within the City of Chicago). The goal of a noise wall is to perceptibly lower roadway noise levels, and not to reduce the noise levels below the NAC. There are often cases where a noise wall is performing as designed, meeting applicable criteria, and the noise levels behind the wall are still above the NAC. If noise impacts were determined for the Preliminary Preferred Alternative behind existing barriers in these areas, the existing barriers were studied to determine if it would be feasible and reasonable to increase the barriers in length and/or height.

IDOT's 2015 interim policy regarding analysis of existing noise barriers states:

> When an existing noise barrier is not physically impacted or relocated as part of a new Type I project and impacts are identified, the noise analyst shall determine if modification of the existing noise barrier is feasible and reasonable for the mitigation of additional impacts related to the new Build condition. The noise analyst will determine the design year noise levels with and without modification of the existing noise barrier. Should modification of the existing noise barrier be determined not feasible or not reasonable as defined in current policy; the existing noise barrier will be left in place without modification.[3]

[3] Noise Assessment Policy Interpretation Memorandum, Illinois Department of Transportation Bureau of Design and Environment. June 25, 2015

There are ten existing noise walls within the project corridor (B1, B2, B3, B4, B6, B7, B8, B9, B10, and B88). At least one representative receptor behind all of the existing barriers was predicted to have traffic noise impacts, except for B8. An analysis was performed to determine if increasing the height of these existing noise barriers would be feasible and reasonable under IDOT's 2015 interim policy for existing noise barriers. A summary of this analysis is in Table 5. It was found that noise barrier height increases at eight of the ten noise barriers would not be considered feasible, as they do not achieve the IDOT feasibility criterion of at least a 5 dB(A) traffic noise reduction at one or more impacted receptor locations. Height increases to the remaining two existing noise barriers did meet the IDOT feasibility criterion, but would not meet the criteria of reasonableness, as they do not achieve the IDOT noise reduction design goal of at least an 8 dB(A) traffic noise reduction at one or more benefited receptors. Since none of the height increases to the ten existing noise walls would be feasible and reasonable, height increases to the existing barriers are not planned as part of this project.

The results of the analysis for length extensions to existing barriers are reported in the following two sections, as their construction is similar to those of proposed new barriers.

TABLE 5
EXISTING I-290 NOISE BARRIERS
HEIGHT INCREASE ABATEMENT ANALYSIS

Barrier	Location of Existing Barrier	Height Increase Abatement Analysis Result	Ratio	Finding
B1	North of I-290, Butterfield Rd. to Wolf Rd.	Does not meet IDOT Feasibility Criterion	n/a	Not Feasible
B2	South of I-290, West of Darmstadt Rd.	Does not meet IDOT Noise Reduction Design Goal	n/a	Not Reasonable
B3	South of I-290, Darmstadt Rd. to Wolf Rd.	Does not meet IDOT Feasibility Criterion	n/a	Not Feasible
B4	North of I-290, Wolf Rd. to Hillside Dr.	Does not meet IDOT Feasibility Criterion	n/a	Not Feasible
B6	South of I-290, adjacent to Oak Ridge Ave.	Does not meet IDOT Feasibility Criterion	n/a	Not Feasible
B7	North of I-290, Mannheim Rd. to Bellwood Ave.	Does not meet IDOT Feasibility Criterion	n/a	Not Feasible
B8	South of I-290, Mannheim Rd. to Westchester Blvd.	Does not meet IDOT Feasibility Criterion	n/a	Not Feasible
B9	North of I-290, Bellwood Ave. to 30th Ave.	Does not meet IDOT Feasibility Criterion	n/a	Not Feasible
B10	South of I-290, Westchester Blvd. to Bristol Ave.	Does not meet IDOT Feasibility Criterion	n/a	Not Feasible
B88	North of I-290, Loomis St. to Entrance Ramp	Does not meet IDOT Noise Reduction Design Goal	n/a	Not Reasonable

West of Mannheim Road to Cicero Avenue (Proposed New Noise Barriers, Proposed I-290 Reconstruction)

The project corridor from west of Mannheim Road to Cicero Avenue (within the villages of Hillside, Westchester, Bellwood, Broadview, Maywood, Forest Park, Oak Park, and the city of Chicago) could receive new noise barriers as a result of this noise abatement analysis. This section of the project corridor is proposed for complete I-290 reconstruction.

Forty-one noise walls were evaluated for the impacted representative receptors within this section, including two extensions of existing noise barriers at B9 and B10. All but three of the noise walls (B12, B29, and B47) were found to be feasible, meaning they could achieve at least a 5 dB(A) reduction at an impacted receptor.

Thirty-six of the thirty-eight feasible noise barriers would meet the first criterion of reasonableness, as they achieve the IDOT noise reduction design goal of at least an 8 dB(A) traffic noise reduction at one or more benefited receptors. The noise walls B11 and B21 would not achieve the noise reduction design goal, and do not meet this reasonableness criterion. Generally, walls are not acoustically feasible or do not achieve the IDOT noise reduction design goal because the nearest receptors to the analyzed barrier are further away than in other locations, limiting the effectiveness of the barrier shadow zone. I-290 crossroad traffic noise contributions also are a factor for barriers B12 and B21. Additionally, the frontage road noise presented a challenge in several cases as it is not abated by the analyzed noise walls. High frontage road noise levels resulted in taller noise walls in order to achieve similar reductions to those found in areas with less frontage road traffic, or result in walls that were not feasible or do not achieve the NRDG.

The thirty-six feasible noise walls that also achieve the noise reduction design goal were then evaluated for cost-effectiveness. Table 6 summarizes the results of the adjusted allowable cost per benefited receptor determination. Each benefited receptor received a base allowable barrier cost of $24,000, which could be increased based upon absolute noise level considerations, increase in noise level considerations, and new alignment/construction data considerations. The range of these cost adjustment considerations per barrier is summarized as "Adjustment Factor Range" in Table 6. Table 7 summarizes the results of the noise abatement evaluation.

TABLE 6
ADJUSTED ALLOWABLE COST PER BENEFITED RECEPTOR
I-290 ANAYLZED NEW BARRIERS: WEST OF MANNHEIM ROAD TO CICERO AVENUE

Barrier	Benefited Receptors	Adjustment Factor Range	Adjusted Allowable Cost per Benefited Receptors

[1] Barrier length and height are not listed for barriers that are not reasonable and feasible.

[2] Based on the IDOT policy value of $25 per square foot

[3] Per IDOT traffic noise policy and the reasonableness analysis

[4] Any receptor receiving at least a 5 dB(A) reduction due to the proposed barrier

[5] Ratio of actual build cost of a barrier per benefitted receptor to the adjusted allowable cost per benefitted receptor. This is used to determine if a barrier can be found cost effective through cost averaging. For a single noise abatement measure to be considered as part of a cost averaging solution, this ratio must not exceed 2.0 (the cost of noise abatement per benefitted receptor may not exceed two times the adjusted allowable noise abatement cost per benefitted receptor).

Forty-one noise barrier locations were studied within this section. Of the forty-one barriers, three were found to not be feasible (B12, B29, B47), and eight were found to be not reasonable. Of the eight barriers found to be not reasonable, two were found to not meet the IDOT noise reduction criterion (B11 and B21), and six were found to be not cost effective (B22, B23, B24, B25, B26, and B43). The thirty remaining noise barriers, which include extensions of existing noise barriers, were found to be feasible and reasonable as stand-alone noise barriers.

Cicero Avenue to Racine Avenue (Proposed New Noise Barriers, Proposed I-290 Restriping)

A noise abatement analysis was completed for potential new noise barriers in the project corridor from Cicero Avenue to Racine Avenue (within the city of Chicago). This section of the project corridor is proposed for I-290 restriping, but no roadway reconstruction is currently proposed for this section of the corridor.

Forty-one noise walls were evaluated for the impacted representative receptors within this section. All but three of the noise walls (B50, B78, and B84) were found to be feasible, meaning they could achieve at least a 5 dB(A) reduction at an impacted receptor.

Thirty-four of the thirty-eight noise barriers considered feasible meet the first criterion of reasonableness, as they achieve the IDOT noise reduction design goal of at least an 8 dB(A) traffic noise reduction at one or more benefited receptor locations. The noise walls B82, B85, B86, and B87 would not achieve the noise reduction design goal, and do not meet this reasonableness criterion. Generally, walls are not acoustically feasible or do not achieve the IDOT noise reduction design goal because the nearest represented receptors to the analyzed barrier are further away than in other locations, limiting the effectiveness of the barrier shadow zone. I-290 crossroad traffic noise contributions also are a factor for barriers B78 and B84. Additionally, the frontage road noise presented a challenge in several cases as it is not abated by the analyzed noise walls. High frontage road noise levels resulted in taller noise walls in order to achieve similar reductions to those found in areas with less frontage road traffic, or result in walls that were not feasible or do not achieve the NRDG.

The thirty-four feasible noise walls that also achieve the noise reduction design goal were then evaluated for cost-effectiveness. Table 8 summarizes the results of the adjusted allowable cost per benefited receptor determination. Each benefited receptor received a base allowable barrier cost of $24,000, which could be increased based upon absolute noise level considerations, increase in noise level considerations, and new alignment/construction data considerations. The range of these cost adjustment considerations per barrier is summarized as "Adjustment Factor Range" in Table 8. Table 9 summarizes the results of the noise abatement evaluation.

B82	South of I-290, Damen Ave. to Ogden Ave.	Does not meet IDOT Noise Reduction Design Goal							n/a	Not Reasonable
B83	South of I-290, Ogden Avenue to Ashland Avenue	1,916	13	$622,700	$19,000,000	700	$27,143	$890	0.03	Cost-Effective
B84	North of I-290, Ogden Ave. to Paulina St.	Does not meet IDOT Feasibility Criterion							n/a	Not Feasible
B85	North of I-290, Paulina St. to Ashland Ave.	Does not meet IDOT Noise Reduction Design Goal							n/a	Not Reasonable
B86	North of I-290, Ashland Ave. to Loomis St.	Does not meet IDOT Noise Reduction Design Goal							n/a	Not Reasonable
B87	South of I-290, Ashland Ave. to Loomis St.	Does not meet IDOT Noise Reduction Design Goal							n/a	Not Reasonable
B88 Ext.	North of I-290, Entrance Ramp to Racine Ave.	883	21	$463,575	$4,374,000	178	$24,573	$2,604	0.11	Cost-Effective
B89	North of I-290, Loomis St. to Racine Ave.	1,457	13	$473,525	$750,000	30	$25,000	$15,784	0.63	Cost-Effective

[1] Barrier length and height are not listed for barriers that are not reasonable and feasible.
[2] Based on the IDOT policy value of $25 per square foot
[3] per IDOT traffic noise policy and the reasonableness analysis
[4] Any receptor receiving at least a 5 dB(A) reduction due to the proposed barrier
[5] Ratio of actual build cost of a barrier per benefitted receptor to the adjusted allowable cost per benefitted receptor. This is used to determine if a barrier can be found cost effective through cost averaging. For a single noise abatement measure to be considered as part of a cost averaging solution, this ratio must not exceed 2.0 (the cost of noise abatement per benefitted receptor may not exceed two times the adjusted allowable noise abatement cost per benefitted receptor).

Forty-one noise barrier locations were studied within this section. Of the forty-one barriers, three were found to not be feasible (B50, B78, and B84), and seven were found to be not reasonable. Of the seven barriers found to be not reasonable, four were found not to meet the IDOT noise reduction criterion (B82, B85, B86, and B87), and three were found to be not cost effective (B70, B75, and B79). The thirty-one remaining noise barriers were found to be feasible and reasonable as stand-alone noise barriers.

Cost Averaging

After the noise barrier locations were considered reasonable or feasible as stand-alone barriers, the noise wall costs were then considered cumulatively, across Common Noise Environments, to determine if any barrier found to be not cost effective standing alone could be cost effective cumulatively. As shown in Table 10, the cost averaging analysis places analyzed barriers in order of increasing cost effective ratio (ratio between the actual cost per benefited receptor and the adjusted allowable cost per benefited receptor). Noise abatement measures achieve the cost reasonableness criterion cumulatively if the cumulative estimated noise wall cost per benefited receptor is less than cumulative adjusted allowable cost per benefited receptor, when considering all barriers that are feasible and meet the noise reduction design goal. Table 10 summarizes the cost averaging analysis.

Considering the noise walls on a cumulative basis, two additional noise walls would be considered cost-effective (B75 and B79), resulting in 63 cost-effective noise walls.

TABLE 10
COST AVERAGING ANALYSIS SUMMARY

Barrier Number	No. Benefited Receptors	Noise Wall Cost	Actual Cost per Benefited Receptor	Adjusted Allowable Cost per Benefited Receptor	Ratio of Est. Build/ Adjust. Allowable	Cumulative Estimated Build Cost/Benefited	Cumulative Adjusted Allowable Cost/Benefited	Result of Determination
B83	700	$622,700	$890	$27,143	0.03	$890	$27,143	Cost-Effective Stand Alone

B88	Does not meet IDOT Feasibility Criterion							

Viewpoints Solicitation

The third component of reasonableness is obtaining the viewpoints of those who would be benefitted by a feasible and cost-effective noise barrier meeting the IDOT noise reduction design goal. Viewpoints solicitation packages, including an informational letter, voting form, a rendering of a typical noise barrier, and maps of the proposed wall, were sent to property owners and tenants at receptors that would benefit proposed walls. Table 11 is a summary of the viewpoints solicitation voting results. The received votes were tallied by noise wall per IDOT policy. 14 of the 63 total noise walls received at least a 33% response rate in the first round of voting, and the remaining noise walls that did not receive a 33% response rate with the initial voting round required a second round of voting. Votes were received until March 2, 2016[4]. If more than fifty percent of the received wall's votes were in support of wall construction, the wall was recommended for construction and will likely be included in final design plans for the project. Conversely, walls that did not have more than fifty percent of the received votes in favor of the wall are not recommended for construction as part of the project. Figure 3 is a map of noise walls recommended for construction following the results of the viewpoints solicitation. Details of voting results are in Appendix C.

Table 11 shows that of the 63 walls up for a vote, 46 walls were voted in favor, and will be recommended for construction. Eight walls will be recommended for construction in Bellwood, Westchester, Broadview, or Maywood (more than one of these villages were present behind a single barrier). Two walls will be recommended for construction in Forest Park. Five walls will be recommended for construction in Oak Park. Thirty-one walls will be recommended for construction in Chicago.

[4] Viewpoints solicitation was reevaluated for the noise study area between 25th Avenue and 1st Avenue due to revisions to the Preliminary Preferred Alternative. For this section of the corridor, final votes were received between August 19, 2016 and October 14, 2016.

TABLE 11
VIEWPOINTS SOLICITATION SUMMARY

Noise Wall	Community	Voting Response Rate[1]	Percent of Votes In Favor	Voting Results	Wall Recommended for Construction?[2]

[1] Of all potential votes of receptors benefited by the noise wall

[2] In order to be recommended for construction, a noise wall must have greater than 50% of votes received in favor of the wall

Likelihood Statement

Based on the traffic noise analysis and noise abatement evaluation conducted, highway traffic noise abatement measures are likely to be implemented based on preliminary design. The noise barriers determined to meet the feasibility and reasonableness criteria are identified in Table 11 and Figure 3. If it subsequently develops during final design that constraints not foreseen in the preliminary design arise or if public input substantially changes, the abatement measures may be modified or removed from the project plans. A final decision of the installation of the abatement measures will be made upon completion of the project's final design and the public involvement process.

SECTION 5: Coordination with Local Officials for Undeveloped Lands

Figure 1 depicts the proposed alignment within the project limits. Undeveloped parcels of land (Activity Category G) adjacent to the project corridor exist in Bellwood, as well as scattered vacant properties in Chicago from Lockwood Avenue to Western Avenue. There is a parcel of undeveloped land in Forest Park (with a recently demolished building), but this parcel has been recently purchased by the Park District of Forest Park for parkland; for this reason, this parcel was included in the CNE for R69.

For local agency planning and development purposes, the Preliminary Preferred Alternative was analyzed to predict traffic noise levels in the undeveloped areas in Bellwood and Chicago. This analysis was a worst-case assessment of noise, assuming no noise barriers in front of the undeveloped areas.

The 66 dB(A) noise contours in the undeveloped areas along the Preliminary Preferred Alternative correspond to the NAC for Activity B and C uses, and were located between approximately:

- Bellwood: The NAC of 67 dB(A) is not expected to be approached, met, or exceeded in the Activity Category G uses in Bellwood.
- Chicago (Lockwood to Cicero): The NAC of 67 dB(A) is expected to be approached, met, or exceeded throughout Activity Category G uses in this area.
- Chicago (Cicero to Independence): The NAC of 67 dB(A) is expected to be approached, met, or exceeded within 500 feet of the nearest outside I-290 mainline travel lane to Activity Category G uses in this area.
- Chicago (Independence to Western): The NAC of 67 dB(A) is expected to be approached, met, or exceeded within 400 feet of the nearest outside I-290 mainline travel lane to Activity Category G uses in this area.

The 71 dB(A) noise contours in the undeveloped areas along the Preliminary Preferred Alternative correspond to the NAC for Activity E uses, and were located between approximately:

- Bellwood: The NAC of 72 dB(A) is not expected to be approached, met, or exceeded in the Activity Category G use in Bellwood.
- Chicago (Lockwood to Cicero): The NAC of 72 dB(A) is expected to be approached, met, or exceeded within 250 feet of the nearest outside I-290 mainline travel lane to Activity Category G uses in this area.
- Chicago (Cicero to Independence): The NAC of 72 dB(A) is expected to be approached, met, or exceeded within 200 feet of the nearest outside I-290 mainline travel lane to Activity Category G uses in this area.
- Chicago (Independence to Western): The NAC of 72 dB(A) is expected to be approached, met, or exceeded within 200 feet of the nearest outside I-290 mainline travel lane to Activity Category G uses in this area.

Appendix B includes letters to be sent to the local officials having jurisdiction over these adjacent undeveloped lands, and an exhibit (as an attachment to the letter), depicting the approximate distances where the NAC is approached.

SECTION 6: Construction Noise

Trucks and machinery used for construction produce noise that may affect some land uses and activities during the construction period. Residents along the alignment will at some time experience perceptible construction noise from implementation of the project. To minimize or eliminate the effect of construction noise on these areas, mitigation measures have been incorporated into the Illinois Department of Transportation's Standard Specifications for Road and Bridge Construction as Article 107.35.

Construction noise effects will be further investigated with stakeholders separately from this analysis, which is intended to address traffic noise.

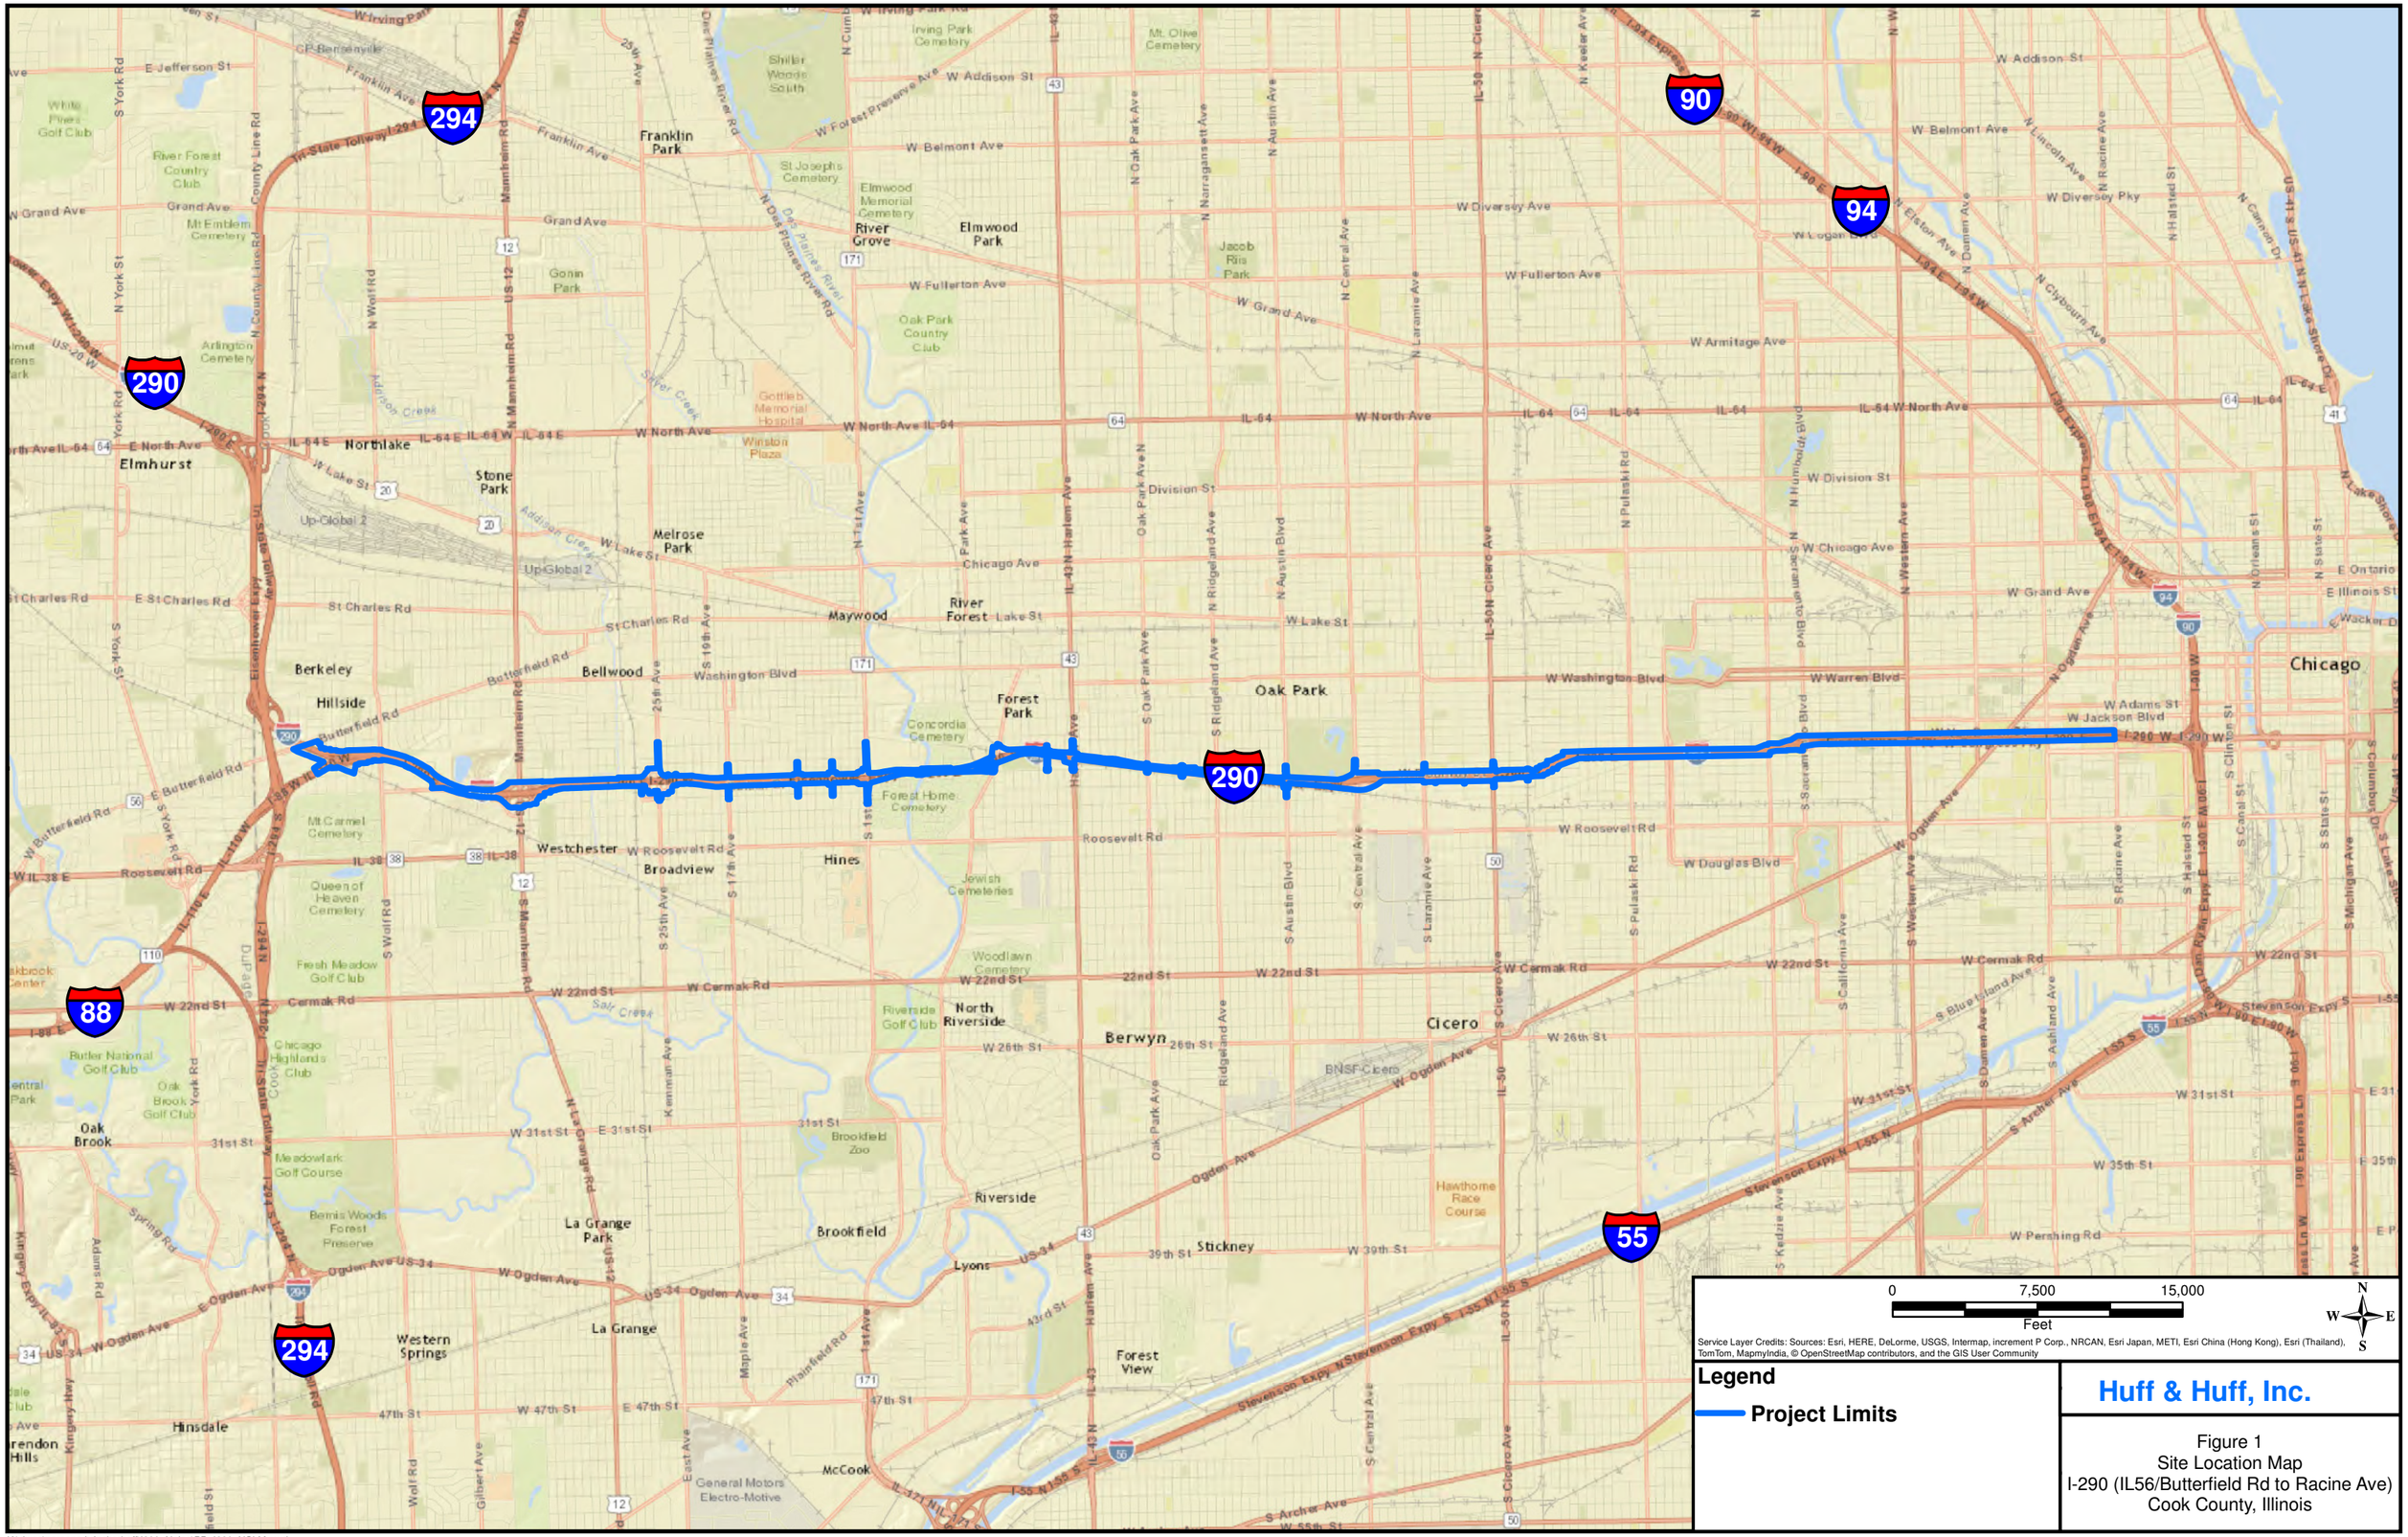
SECTION 7: Conclusion

This traffic noise study has been coordinated to evaluate traffic noise impacts for the proposed improvements to the Eisenhower Expressway (I-290) from west of Mannheim Road to Racine Avenue. Traffic noise was evaluated at 288 representative receptor locations. The Existing noise levels range from 57 dB(A) at R256 to 78 dB(A) at R100, R119, R172, R198, and R206. The projected No Build 2040 traffic noise levels range from 57 dB(A) at R256 to 79 dB(A) at R119 and R172. Representative receptor noise levels either remain the same or increase up to 3 dB(A) from the Existing condition to the 2040 No Build condition; the majority of areas have no change or a 1 dB(A) increase in noise from Existing to 2040 No Build.

A sensitivity analysis for the four Build alternatives carried forward indicated there would be no significant or perceptible change in noise among these alternatives.

The projected Preliminary Preferred Alternative traffic noise levels range from 58 dB(A) to 79 dB(A). In the proposed 2040 Build scenario for the Preliminary Preferred Alternative, 228 representative receptor locations are impacted because noise levels approach, meet, or exceed the NAC, and therefore warrant a noise abatement analysis. None of the representative receptors are impacted due to a substantial increase in noise.

Ninety-two noise walls were evaluated for the impacted representative receptors, including the extension of three existing noise barriers and the potential height increase of ten existing barriers. Seventy-six of the ninety-two noise walls in new locations studied met IDOT's feasibility criterion. Seventy of these seventy-six feasible noise barriers achieved IDOT's noise reduction design goal of at least an 8 dB(A) traffic noise reduction at one or more benefited receptor locations.



The seventy feasible noise walls that also achieve the noise reduction design goal were then evaluated for economic reasonability. Based on the evaluation, 61 of the remaining seventy noise walls would be economically reasonable on a stand-alone perspective, as the actual cost per benefited receptor does not exceed the adjusted allowable cost per benefited receptor.

The noise walls' cost-effectiveness was then considered cumulatively, which resulted in two additional noise walls being cost-effective, bringing the total number of cost-effective noise walls to 63. Highway traffic noise abatement measures at these 63 locations were brought to the public for viewpoints solicitation, based on preliminary design. The noise barriers determined to meet the feasibility and two of the three reasonableness criteria are identified in Tables 7 and 9, and are shown in Figure 2.

Results of the viewpoints solicitations process found that of the 63 walls up for a vote, 46 walls were voted in favor, and will be recommended for construction. Eight walls will be recommended for construction in Bellwood, Westchester, Broadview, or Maywood (more than one of these villages were present behind a single barrier). Two walls will be recommended for construction in Forest Park. Five walls will be recommended for construction in Oak Park. Thirty-one walls will be recommended for construction in Chicago. Figure 3 is a map of the noise walls recommended for construction.

If it subsequently develops during final design that constraints not foreseen in the preliminary design occur, or public input substantially changes reasonableness, the abatement measures may need to be modified or removed from the project plans. A final decision on the installation of abatement measures will be made during the project's final design phase, which includes additional public involvement and aesthetics coordination.

Existing barrier to remain in place or
be replaced by barrier with the same noise attenuation line.
Additional height added to barrier is not feasible,
as it does not meet the feasibility criterion.

Re: Traffic Noise Information for Undeveloped Lands
Eisenhower Expressway (I-290) Reconstruction

The Illinois Department of Transportation is currently conducting environmental (Phase I) preliminary engineering studies for proposed improvements to the Eisenhower Expressway (I-290) in Cook County, IL. The proposed improvements include reconstruction of the expressway from I-88 to Cicero Avenue/IL Route 50, as well as roadway restriping from Cicero Avenue/IL Route 50 to Racine Avenue.

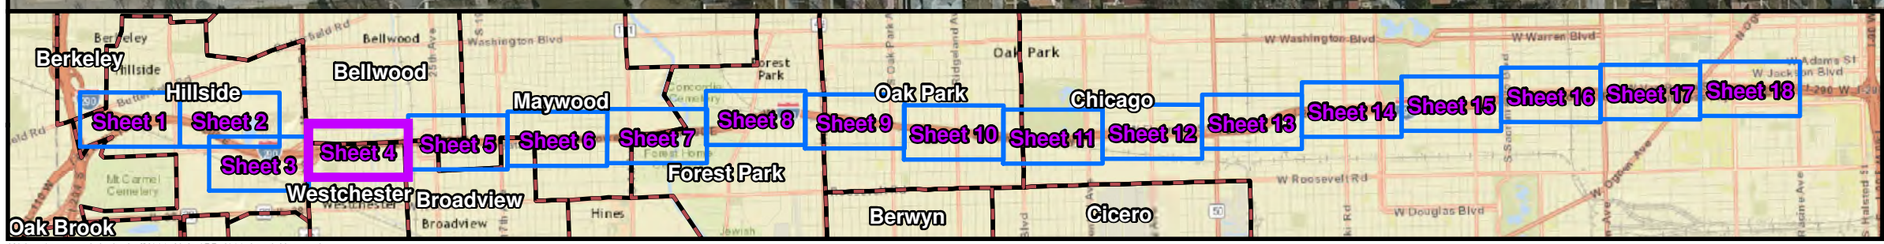
As part of the Phase I Environmental Study for this proposed project, projected future traffic noise levels were evaluated for lands (either currently under your jurisdiction or land that may come under your jurisdiction) near the proposed roadway improvement. For your information, this study area includes land that may be planned for future development in a comprehensive land use plan.

This letter includes an exhibit showing the predicted design year (2040) build traffic noise levels for the undeveloped lands along the project corridor within your jurisdiction. This information is for your use in planning and permitting future development. We recommend that you carefully consider the future predicted noise levels to avoid potential issues of public concern over incompatible noise levels.

The figure shows currently vacant/future development areas in red, and also shows the distance from the center of the nearest outside I-290 mainline travel lane (based on the proposed improvement) to both the 66- and 71-dB(A) noise level contours.

- A 66-dB(A) noise contour represents noise levels that would be a noise impact for residential areas, schools, places of worship, medical offices, recreational areas, and institutional uses.
- A 71-dB(A) noise contour represents noise levels that would be a noise impact for hotels, restaurants, and offices.

To help with your future planning and discernment regarding permitting decisions, we encourage you to obtain the Federal Highway Administration (FHWA) publication titled *Entering the Quiet Zone: Noise Compatible Land Use Planning*. This publication can be obtained from the FHWA website:



www.fhwa.dot.gov/environment/noise/noise_compatible_planning/federal_approach/land_use/quietezon.pdf

For additional information regarding traffic noise, regulations and policy, noise analyses or noise abatement, we encourage you to visit the Department's web site at: http://www.dot.il.gov/. Click on the "Environment" link and then the "Traffic Noise" link to access this information.

Sincerely,

NAC noise levels (either 67 dB(A) or 72 dB(A)) are not expected to be reached in this location in the 2040 Build condition.

Comments:
I am 100% in favor of the wall. Drivers is getting use to exiting at Gardner Rd making the U turn. I have witness two accidents since the time I have moved to the area (1998). I hope with this new design, it would stop the semi trucks. Thank you

A wall would obstruct the beauty of nature viewed daily such as the trees and foliage along with the various vehicles going to and from also an accident would be viewed to call for assistance. I am really not in favor of a concrete wall however I would consider a transparent wall, but if its concrete I am not in favor of it. Thank you

Comments:

Weeds and vegetation is not a sound barrier. It's nature's home for wild animals skunks possums coons etc which have wandered into the residential areas. Asteticallyit is horrible to have wild vegetation blocking ones view catching highway debris paper cans bottles etc.

Please respond by November 23, 2015.

Comments:

Who pays for this Wall? Taxes are High Enough
Why do we need a Wall when there are other
things to address. All these Barriers Everywhere
What would be the real purpose for the Wall
We need our Streets fixed, All of these Big [redacted] holes
What will Be the Benefit of All this? Less Noise ?
I'm not sure of All that's going Now.

Comments:

When my son was born in 2007, it was very difficult to get him to sleep. Every 10-15 minutes, there would be a large truck that would wake him up. We actually are in the process of moving out next year, and the noise level from the highway was a major reason for this. Even now, the noise from the highway will sometimes wake us all up in the middle of the night from motorcyclists drag racing at 2 AM.

Please respond by November 23, 2015.

Comments:

WE'VE INVESTED IN NEW WINDOWS, INSULATION & SOME FOLIAGE TO MINIMIZE THE NOISE IMPACT, NOTHING HAS WORKED. A NOISE WALL WILL BE AN ANSWER TO PRAYER. MANY OF THE NEIGHBORS COMPLAIN ABOUT THE NOISE LEVEL. WE WOULD BE EXTREMELY SURPRISED IF YOU DO NOT RECEIVE RAGGING SUPPORT FOR THE CONSTRUCTION OF THE NOISE WALL. WE CAN ACT AS A COMMUNITY ADVOCATE IF NEEDED. GIVE US DIRECTION ON THIS.

Comments:

(1) it is not needed, Garfield st. is noiser.

(2) how can the fire dept. help, as it has before, with the possibility of fire on x-way from above on Harrison or Garfield?

(3) anyone who moved here knew about the x-way, so if they need a wall, put it in front of their houses only.

(4) it would cost too much + be a waste of money.

Please respond by November 23, 2015.

Please return this form ONLY in the enclosed envelope, to:

I-290 Noise Wall Viewpoints
Illinois Department of Transportation
c/o Huff & Huff, Inc.
915 Harger Road, Suite 330
Oak Brook, IL 60523

(5) it would provide a 'canvas' for various [redacted] B30 [redacted] graffiti artists, and would need periodic cleaning.

P.S. Thanks for [illegible]

Comments:

I WOULD PREFER TO SEE A TUNNEL IN WHICH THE I-290 EXPRESSWAY IS COVERED TO CREATE PARK SPACE AND A CONNECTION BETWEEN THE TWO SIDES OF OAK PARK. I WOULD APPROVE OF NOISE LEVEL REDUCTION, BUT DON'T BELIEVE THIS IS THE BEST OPTION.

BY THE WAY, YOUR "SELF ADDRESSED, STAMPED ENVELOPE" WAS MISSING THE STAMP. I PLACED ONE ON FOR YOU.

Comments:

Those of us living along the corridor and literally have the Eisenhower in our back yards, feel sound walls will significantly improve our quality of life and increase our property values. People are historically against change, but a sound/visual barrier wall will benefit the whole village by protecting us from the excessive noise and pollution from the expressway. Significantly widening the Oak Park Avenue bridge could become a beautiful gate-way between both sides of South Oak Park and would connect two viable business districts. That could make everyone happy!

Comments:

I don't prefer the "cheapest" option for very limited benefit noise suppression. From what I've seen the noise levels will only come into specification levels very close to the wall; others a few meters away will still not benefit from a noise or aesthetic perspective. There are better overall options, such as a "cap", that will have long lasting, social, economic benefit to our community.

Comments:

Absolutely not. My parents house is in Hillside south of ~~I-88~~ 290! The noise wall there did little to stop pollution (only the deconstruction of the asphalt plant did that) and made the roads worse for people (no BLOCKS away) Absolutely not. And the Harrison street corridor by Hasem is still loud & polluted.

Please respond by November 23, 2015.

Comments:

NOISE IS NOT A PROBLEM. IN FACT, WE ENJOY OUR "URBAN OCEAN". IT FADES INTO THE BACKGROUND.
NO COMPLAINTS
WE ARE VERY CONCERNED ABOUT LOSING DIRECT SUNLIGHT DUE TO THE WALL OVERLAPPING/OBSTRUCTING OUR WINDOWS. WOULD BE A HUGE LOSS OF HEAT (COLD BUILDING – VERY COLD IN WINTER) AND A LOSS IN PLEASURE AND VALUE TO OUR APARTMENT

Please respond by November 23, 2015.

Comments:

IT IS IMPORTANT THAT THE WALL HAS AN AESTHETIC QUALITY TO IT AS IT WILL BE HIGHLY VISIBLE. A BUDGET FOR WALL MAINTANCE SHOULD BE ADDED TO OP BUDGET. WALLS SHOULD BE CONSTRUCTED BEFORE "COMPLETE RECONSTRUCTION" OF I-290 BEGINS, IN ORDER TO LIMIT IMPACT OF CONSTRUCTION NOISE AND DUST ON THE COMMUNITY.

Comments:

This is a terrible idea that only further divides the city. My hope is that because this is required by the Fed, that you make the walls as ridiculous as possible to prevent anyone in their right minds from voting "yes". Please consider alternatives if this moves forward such as decking over the Ike to make the barriers an asset instead of a liability. Please also consider that tenants are inherently transient and should have little bearing on if the project moves forward.

Comments:

I like to see over the bridge. I do NOT want to see a wall. My daughter takes the EL to work, I like it that I can see her get on or off the EL. I feel with the wall our village will feel spit, and I dont like that. I feel that graffiti will be an issue if the wall are put up. I have live in my house insince 1963 and I like the way it is. I feel that the wall will make Oak Park look like a prison, SO I VOTE NO!

Comments:

I think it would have been helpful if the expected noise levels had been more clearly/obviously presented. It took reviewing the two-volume Noise Analysis study to find out if the future scenarios would be showing an increase in noise. The study shows just about every receptor would have no perceptible increase in noise even before the wall, and I think those facts are important and missing from the public discussion. Otherwise, you're voting on a noise wall when you don't even understand the expected noise levels.

Comments:

I would support a "green-wall" that has evergreen plants. I do not, however, support the noise wall as currently designed. My daylight would be dramatically reduced. A green wall would still have porosity, but also reduce noise. A green wall would also provide fresh air.

Comments:
I do not support the construction of the noise wall because I don't think it is necessary. I have been tenant on this Property for 4 years and [redacted] no one Complaint about the noise. In fact, If the construction begin will bring us a lot of inconvenient. street will block, hard to find Parking, noise and dust from construction [redacted] .etc. Furthermore, It is sometime for people to enjoy of view of trains and cars passing by.

Please respond by November 23, 2015.

Comments:
Please don't do this to us! We don't want to look like Belfast or Berlin — walls are magnets for graffiti and make neighborhoods isolated. We would love a cap on the expressway to not only reduce noise, but BRING US TOGETHER rather than further dividing our town. Meanwhile, no walls, please!!

Comments:

I have lived here 41 years - 4 times exposed to the noise and adapt I would be very upset about having a barrier where I would look out and see a wall - Now I can see green and beautiful Building across the Xway - Several years ago a few trees were planted on the grassy Knoll. It was good but not enough - Many trees would be the most beautiful way to re-start planting now - In ten years they'd be beautiful & will clean the air of CO_2 and produce O_2 - We have many hundred feet of grassy area now unsightly barrier, stop noise and dividing old Park! In 10 years we may have many quiet clean electric cars making all of this unnecessary. Plant trees now this area doesn't need a wall.

Comments:

It is already very noisy. Blue line train is extremly noisy, in comparison with green line., when will the blue line be renovated?
Motorcycles during summer run at very high speed, very noisy! I live on 3rd floor, is 15' height for the noise wall enough to reduce noise level at that elevation?
I am very concer redabout health issues caused by all this noise!

COULD we have a natural wall instead? Maybe Arborvite trees? It'll be claustrophobic over here. Our houses are really close. Plus, we often look over the expressway. It's a strange yet enjoyable neighborhood thing. We often do as neighbors. I think a wall will look more like urban blight. We wouldn't even be able to see across the expressway :)

Comments:

while we'd support walls down by the tracks, we do not support them along the frontage road (Cambridge), as we believe they would isolate Southern Oak Park even more from the rest of Oak Park, be a target for graffiti, and add for, sound improvement, we moved to this area because we like and appreciate the urban elements - we feel the sound wall would isolate us like many suburbs. minimal

Comments:

Our police and fire dept. use Garfield St. To check on accidents, etc. on I-290. Maybe more evergreens would block the noise. Evergreens would be great, beautiful and work all year because they don't lose their needles. Once the trees lose their leaves - the noise is louder. Also can CTA reduce the noise levels on their trains? That's where the real noise comes from.

Comments:

A WALL WILL ONLY SERVE TO FURTHER SEGREGATE S.E. OAK PARK FROM THE REST OF THE VILLAGE. IT WILL BE A PRIME TARGET FOR GRAFFITI. ALSO, WHY WOULD A TENANT, WHO IS NOT A STAKEHOLDER, BE ALLOWED A VOTE THAT IMPACTS THE PROPERTY VALUES OF THE HOME OWNERS? IF NOISE IS AN ISSUE FOR THEM, THEY COULD EASILY RENT ELSEWHERE.

NO WALL!!

Eisenhower Expressway (I-290)
West of Mannheim Road to Racine Avenue
Cook County

Date: 11/30/15

Do you support the construction of the noise wall?

X Yes

_____ No

Name: [redacted]

Address:

Signature:

Select One: Owner of this property: _____ Tenant on this property: X

Comments:
I Am supporting the Construction because I think the traffic noise will increase after the proposed improvements are made. I believe it will also, however, create a visual/mental separation of Oak Park South/North of the Eisenhower. [redacted]

Please respond by November 23, 2015.

Comments:
Money not well spent / Grafetti / Illinois doesn't employ African-Americans/Males for their transportation improvements. Drive to Indiana and you witness the difference. It's always inclusive. with a a males employed. thanks
P.S Glad the CTA ramps will be removed a flat surface access is so better.

Comments:
I'm happy to read that something is going to be done to improve pedestrian safety on the crossroad bridges and for accessing the CTA Blue lines. This is a very dangerous bridge to cross (at Austin). I've almost been hit a number of times. The cars that are turning right onto I-290 are especially rude. They have the green light at the same time the pedestrians have the sign to cross. They don't yield to us

Comments: It is noisy over here! And, watching I290 traffic when I go for my evening walks just reminds me of my unpleasant commute to Oak Brook every weekday. The summertime motorcycles, trucks, cars and their loud noise are brutal. The wall will be very welcome, however, it would be much nicer to have an art wall, a peace wall, or something to make it stand out in a positive way.

Comments:

The wall would be a permanent one to the south of Oak Park. The 53 years I have lived here I have never heard ANYONE complain about noise. The expense of cleaning any graffiti (and there will be some) + keeping the wall in good order, will ultimately raise TAXES. SOMEONE Has to pay to keep it presentable.

Comments:
In the few months that my wife and I have lived in Oak Park after moving from [redacted] we have really enjoyed living in this town and when the time comes to buy, we are very much leaning towards buying here so we will likely be affected by this. We are against the wall since we believe it will destroy our view. I enjoy the hum of the road or occasional ding of the "L" doors. I consider Oak Park charm.

For 3 years.

Comments:

I would love to not have my volume on my T.V. maxed out due to the highway/Train. It really can disturb sleeping with the constant noise. Plus I like the privacy it gives us! I like the architecture of the wall, very pleasing to the eye.

Comments:

The views from Railroad Ave. of the downtown skyline and trees in Columbus Park are some of the best things about our humble neighborhood. We would prefer more traffic noise to losing that. We also believe there are more natural options available for the CSX-owned strip of land N. of Railroad that should be considered. A small berm with trees and native plants would both help with noise and add something positive to the neighborhood. Please consider such options. Thank you.

Please respond by November 23, 2015.

I would really like to see downtown still as we enjoy that. However noise walls probably help with property value. The noise doesn't bother us but it's something "better" communities have and we'd like to have that!

Comments:
THE NOISE IS NOT A PROBLEM FOR MY COMFORT. BUILDING A NOISE WALL WOULD PROVIDE AN UNSAFE ENVIRONMENT FOR A COMMUNITY OF SINGLE FAMILY HOMEOWNERS WITH ELDERLY RESIDENTS. THE ~~WOULD~~ WALL WOULD PROVIDE A VIRTUAL CRIME PLAYGROUND FOR DRUG ACTIVITY: EASY ACCESS OFF AND ON THE 290 BETWEEN LARAMIE AND CENTRAL. THE AREA WOULD BE TOTALLY SECLUDED FROM VIEW, ALL THAT IS NEEDED FOR ILLEGAL ACTIVITY.

Comments:

The design is awesome. My concern would be the increase of drug sales noted in the community. Documentation has been in the neighborhood has been addressed in news articles (magazine) as well as at least two or three drug related deaths from drugs purchased by suburban people young to middle age caucasians purchasing drugs. Within the past yea

Comments:

This wall would prove too confining & depriving of view + Greenery. Who is it to protect? I've lived here 54 yrs & would feel imprisoned + cut off from society. It is ugly & would actually cause a farther decrease in property value. Suggestion: Plant more trees + Greenery (a natural buffer) to aid in decreasing noise level.

Comments: Awful, horrendous, terrible idea. I equate this with stealing the sunlight & view. I have lived in this community 45 years & on this block forty years. Although we often feel forgotten by police & city services, rampant crime on the streets. The view from the expressway (whether sitting, standing or driving) is a ray of sunshine. This is emprisoning of community & streets

Comments: Due to the violence, drugs & lack of police support our neighborhood is not the community I moved in forty years. One of the few rays of sunshine is the view from my porch or street of the expressway. I'm not an engineer but no amount of wall is going to muffle the sound of the train & the cars on the expressway. I hate the idea, it imprisoned our streets & community.

Comments: I hate this idea! I have rode along roadways & visited communities with sound walls. It stifles the view & blocks the sunlight. It also feels like a tunnel. In this day of advance technology I know there should be other ways to dampen the noise of traffic. Ways that are less constricting & imprisoning. Bad idea in the name of progress

Comments:

It's not necessary, needed or wanted. I have lived here for 40 years and love the view of the Expressway. The openness the view provides is welcoming. A wall would just close us in. NO-NO-NO

Comments: I personally do not see it as a benefit to the community and there are several reasons why I am against this wall being constructed:

1. It looks like a prison wall and that is the last thing I want my property to be near. Even if plants were to grow on the wall, it still gives the appearance of blocking the view of the neighborhood as it grows and changes. The wall would give a negative first impression of the neighborhood. It would look like the city is trying to hide certain neighborhoods from the passing public. It would also bring down the property value of any land near it.
2. The noise is so minor that you can get the same noise just from street traffic on Jackson Blvd. which is one block north of my building and two blocks north of the expressway. You don't build noise walls to block noise from major streets so why cut off the expressway.
3. I use the view of the expressway to determine the density of traffic and decide if extra time should be used to get to my destination. The expressway also serves as a source of visual interest.
4. The only buildings west of the railroad tracks are industrial buildings and they make enough noise on their own. When taking into consideration the small businesses, it will be hard to see them from the expressway.
5. If you are trying to stop some of the noise where new residential buildings are being constructed you will find that most, if not all, of these new buildings are more than 17 feet tall and very little noise would be stopped by putting up a wall because there also happens to be an "on ramp at Western. Also these new buildings are probably already insulated against noise.
6. If you are not going to increase the number of lanes from 4 to 5 you may be taking away from the greenspace that borders the expressway which holds a beautiful landscape for those of us who like to look at the traffic and across the expressway and at the park on the other side of the expressway as well.
7. My last but most important point is that it appears that no one who is working on this project lives in the neighborhood for which you want to build this monstrous wall. If you had to look at a blank wall day in and day out you would know what a person in jail would feel like. You would feel like you are being cut off from the flow of the city. I've lived here for all but 5 of my 61 years of my life and I don't like your proposal as far as the wall is concerned.

Comments:

I APOLOGIZE FOR MY DELAYED RESPONSE; HOWEVER, I WAS OUT-OF-TOWN ON BUSINESS AND AM NOW GETTING TO MY MAIL. MY PRIMARY REASON FOR OPPOSING THE NOISE WALL IS DUE TO NEIGHBORHOOD SAFETY. THE IMMEDIATE AREA IS SOMETIMES UNSAFE AND I FEEL THE WALL WILL ACT AS A VISIBLE BARRIER THAT MAY SHIELD THOSE COMMITTING WRONG-DOING. IT IS BEST LEFT OPEN.

Please respond by November 23, 2015.

Please return this form ONLY in the enclosed envelope, to:

Comments:
I don't hear enough noise to make the spend of for something like this worth the effort and cost. I live in the city and expect a certain noise level. My concerns over safety issues building something like this could potentially create more issues than any benefit I can see. Not to mention potentially creating a large canvas for graffiti

Comments:

I feel safer walking in this area with it opened up and able to see from a distance. Also, not being able to see the expressway will be an inconvenience because knowing whether or not there is traffic will determine what route I take for the day.

Comments:

If the department has not considered already perhaps a "planted noise barrier" would be a good choice. This will help environmentally as well as maintain the Asthetic look of the wall and give a pleasent feeling to the surrounding neighboorhood and area.
All the best with the project.

Comments:

THE EXHIBIT PROVIDED SHOWS AN EXISTING NOISE BARRIER IN FRONT OF [redacted] THIS DOES NOT EXIST. I DO NOT BELIEVE A 20' NOISE WALL IS ANY BENEFIT TO A BUILDING WHICH THE FIRST FLOOR OF CONDOS ARE 20' ABOVE GRADE. ALSO, I THINK A NOISE WALL WILL CREATE AN UNSIGHTLY BARRIER IN THE NEIGHBORHOOD, AND BLOCK VIEWS FROM PEDESTRIANS

Comments:

I own a unit at [redacted] and pay property and state taxes. I would like my vote to count. I DO NOT want a sound wall! I do not want to lose my view from my porch. The sound does not bother me enough to lose my view. I vote a strong NO for the sound wall!

If you do build this wall, I will expect the state to lower my property/city/state taxes!
We deserve a vote!

Comments:
As a resident living in the west loop for the past 19yrs, I feel the wall barrier is a eye sore, and I do not have any complaints about the noise from the expressway. In my opinion, since the state is struggling with funding. these funds could be reallocated to another programs (Day care, Afterschool programs or Senior progra

Comments:
I enjoy looking at the expressway. I do not want to look at a wall and feel like I'm boxed in. I like to close and I'm facing the expressway. I don't want to have a wall right in front of my face. Please don't put this wall in my face. The noise does not bother me, after all these years. I've never been in jail and don't want to feel like I'm living there!

Comments:
Truely believe this program is not good for the neighborhood. Too many closures in the area already. Plus expressway is already not being cleaned up all the time and left with dead trees in the area. Plus if any accidents occur people can receive help as quickly as possible.

Comments:

I LIKE SEEING the Traffic FLOW ON the Expressway
I ALSO LIKE SEEING Whats GOING ON ACROSS THE
Express WAY THE WALL WONT REDUE my Property TAX
WON'T MAKE ME feel Any SAFER The Wall Will
BE A WASTE of my TAX Dollars.

Comments:

I do not approve of this project. I feel it would look very ugly and lower our property. We have lived in this house over 20 years and the noise has never been an issue.

Please respond by February 10, 2016. If you have already responded, please do not respond again. Thank you for your participation!

Please return this form in the enclosed envelope, to:

Comments:

Our home faces the expressway. Building a wall completely eliminates any visibility when standing on our porch or looking out the front window. I believe this will have a negative impact on our property values, and could serve as an obstacle for selling our homes. While living near an expressway is definitely not a selling point, looking directly at a brick wall will not attract buyers. Additionally, many people find looking out at the expressway very meditative and calming, believe it or not. Lastly, we believe it is unfair to include over 30 renters in this vote. Tenants on Harrison are not vested in the area and move within 1-3 years. Allowing them to dictate the outcome of our financial investment is flawed and unjust.

Please respond by February 10, 2016. If you have already responded, please do not respond again.

Comments:

[redacted] is the only block that will face the noise wal The wall will give kids an opportunity to spray paint which will give residents a wall of graffiti to view. Which in turn would bring the property value down. You will not be able to enjoy the beautiful OAK PARK scenery by putting this wall up. PLEASE DO NOT INSTALL NOISE WALL!

Comments:

I do not like the proposal of the noise wall, First Because it does not cause any noise to us and Second a wall would make our neighborhood be Secluded. From the rest of the neighborhoods and I like to walk and see the city From a Far, a wall would impede the view.

I support The Noise Wall due to The Noise it Makes and The Shaking OF The Property, Some Times Our Lock's are OFF Centered. Traffic that Hit The Ramp "TRUCK's" at Kostner Makes a Loud Boom Day + Night. Also Peoples Use That Side OF the Street as a Garbage Dump Sey at Night + DRUG DROP OFF Day + Night. No Camera's

Comments:

The noise level is only obvious when I'm in my back yard. I have no problem with the noise level. I rather enjoy it because I happen to love the noises of the city. A sound wall may make the noise level decrease, but it makes the area more unattractive.

Comments:

The Sounds from the expressway does not bother me, in fact it acts as an alarm clock sometimes waking up to the sounds of traffic, very faint. So where's the benefit of this wall or does it serve as protection from the neighborhood.

Comments:

I absolutely do not support construction of the noise wall its a form of imprisonment which is definitely not a beautiful sight nor is it peaceful to the mind plants and shrubs can be a noise barrier and much more pleasant to look at with the beauty of the greenery scene let the beauty of the land shine through not a prison wall

915 Harger Road, Suite 330
Oak Brook, IL 60523

Benefitted Receptor Viewpoint Form
Revised Noise Wall Design

Project and Environmental Studies
Eisenhower Expressway (I-290)
West of Mannheim Road to Racine Avenue
Cook County

Date: Sept 5, 2016

Do you support the construction of the noise wall?

✓ Yes

_____ No

Name: [redacted]

Address: [redacted]

Signature: [redacted]

Owner of this property: _____ Tenant on this property: _____

Comments:
What I'm most concern about is flooding. The last time work was done on the 290 whenever there was a heavy rain the sewers on the block would backup & the streets would flood, which would cause worry about basement flooding.

Please respond by September 9, 2016. Thank you for your participation!

Comments:
I support the noise walls only if the exit at 17th remains the same. Meaning that cars exiting should EXIT the 290 close to 15th Ave where it is at the present time. NOT at 13th OR 14th Avenue.

Comments:

I AM AGAINST THE WALL BECAUSE THE NOISE LEVEL IS NOT OF THE LEVEL TO BE DISTURBING. MORE DISTURBING IS THE OVER GROWTH OF THE AREA OF TREES, BUSHES AND WEEDS. THE ILLINOIS DEPARTMENT MAKES NO EFFORT TO MAINTAIN THE LANDSCAPE IN MY AREA AND THE SAME LEVEL OF NON CARE WOULD OCCUR WITH THE WALL! THE ENCLOSED PICTURE SHOWS THAT! KEEPING IT LANDSCAPED WOULD BE A CHEAPER AND BETTER WAY TO IMPROVE THE AREA!

Comments:
This form was addressed to [redacted] rather that me; the property owner. I am against the noise for the section of 9th Ave thru 5th Ave. & Bataan due to the fact that this area is above expressway level and currently ~~with dirt & foliage~~ barricaded with dirt & foliage to subdue sound/noise.

Comments:

(1) If this Barrier were to be Installed, how would this effect the proper Value?, and would this cost the property owners in the future; tha Benefit from This Wall? (2) why is it Just benefitting the Property owner on the Southside of Eisenhower Expressway from 18th Ave. To 16th Ave, BATH Dr. to Lexington St. and also a few homes Just South of Lexington St.; Why is it NOT Benefitting the property on the Northside of the Expressway as well, (3) are these property being Targeted for: STATE, County financial gains?

Comments:
Because the neighborhood is inundated with rats, raccoons, rabbits and other burrowing wild animals that build their homes in forest-like surroundings it would make the area cleaner and brighter with cleanliness and less garbage being strewn about

Illinois Department of Transportation

Memorandum

To:	John A. Fortmann	Attn: Peter A. Harmet
From:	John D. Baranzelli	By: Thomas C. Brooks
Subject:	Natural Resources Review	
Date:	December 13, 2013	

FAI 290 (I-290) (Eisenhower Expressway) Addendum D
Cook County
From IL 50 (Cicero Avenue) to Halsted Street
City of Chicago
T39N, R12E, S13, S14, S15, S16, R13E, S16, S17, S18
Sequence number 9274D

Project description. The project consists of additional project length from Cicero Ave. to Halsted St. for proposed operational improvements/managed lanes east and west bound for Addendum D. There is unknown additional right of way and unknown tree removal and no instream work. No additional wetland or WOUS survey was needed for Add. D. The Add. D project area is urban residential and commercial along a multi-lane expressway near downtown Chicago. Project trees within the ESR limits are limited to a thin strip along the expressway.

Review for Illinois Endangered Species Protection and Illinois Natural Areas Preservation – Part 1075

The Illinois Natural Heritage Database contains no record of State-listed threatened or endangered species, Illinois Natural Area Inventory sites, dedicated Illinois Nature Preserves, or registered Land and Water Reserves in the vicinity of the project location that will be impacted. There are buffers of 3 peregrine falcon records, but they are far enough away that there will be no impacts. In addition, there is no suitable habitat in the project area for this species. **Therefore, consultation under Part 1075 is terminated.**

This review for compliance with 17 Ill. Adm. Code Part 1075 is valid for two years unless new information becomes available that was not previously considered; the proposed improvement is modified; or additional species, essential habitat, or Natural Areas are identified in the vicinity. If the proposed improvement has not been implemented within two years of the date of this memorandum, or any of the above listed conditions develop, a new review will be necessary.

Review for Illinois Interagency Wetland Policy Act – Part 1090

The National Wetlands Inventory does not show wetlands in the vicinity of the project location. **Therefore, the wetland review under Part 1090 is terminated for Add. D.**

Review for Endangered Species Act - Section 7

See the attached US Fish and Wildlife Service list of endangered, threatened, proposed and candidate species and proposed and designated critical habitat that may be present within the county in which the proposed project is located. We cross-referenced the preferred habitat of each listed species with our knowledge of the project area and determined that there may be suitable habitat for the Northern long-eared bat. Because of the urban environment, nearness to downtown Chicago, paucity of trees and their location adjacent to the multi-lane expressway, the suitability of habitat for this species is low. We conclude absence of Northern long-eared bat in the project area.

Attachments—USFWS species' county list

Illinois Department of Transportation

To:	John A. Fortmann	Attn: Peter E. Harmet
From:	John D. Baranzelli	By: Thomas C. Brooks
Subject:	Natural Resources Review	
Date:	April 10, 2014	Thomas C. Brooks

I-290 Addendum A,B and C
T39N/R12E/S13
Cook County
Seq. #9274, 9274A, 9274B, 9274C

The proposed project involves total reconstruction and adding one lane on US 12/20/45 (Manheim Road) to Illinois 50 (Cicero Avenue).

The amount of land acquisition is undetermined. There will be in-stream work. The amount of tree removal is undetermined. Land cover in the vicinity of the proposed improvement is residential.

Review for Illinois Endangered Species Protection and Illinois Natural Areas Preservation – Part 1075

The Illinois Natural Heritage Database contains no record of State-listed threatened or endangered species, Illinois Natural Area Inventory sites, dedicated Illinois Nature Preserves, or registered Land and Water Reserves in the vicinity of the project location. **Therefore, consultation under Part 1075 is terminated**.

This review for compliance with 17 Ill. Adm. Code Part 1075 is valid for two years unless new information becomes available that was not previously considered; the proposed improvement is modified; or additional species, essential habitat, or Natural Areas are identified in the vicinity. If the proposed improvement has not been implemented within two years of the date of this memorandum, or any of the above listed conditions develop, a new review will be necessary.

Review for Illinois Interagency Wetland Policy Act – Part 1090

The National Wetlands Inventory shows wetlands in the vicinity of the project location. The INHS conducted wetland surveys previously. The WIE is still pending.

Review for Endangered Species Act - Section 7

See the attached US Fish and Wildlife Service list of endangered, threatened, proposed and candidate species and proposed and designated critical habitat that may be present within the county in which the proposed project is located. We cross-referenced the preferred habitat of each listed species with our knowledge of the project area and determined that listed species and critical habitat are not present.

Should the proposed improvement be modified or new information indicate listed or proposed species may be affected, consultation or additional coordination should be initiated.

Synopsis

As required by the Paperwork Reduction Act of 1995 (44 U.S.C. 3507), the FCC is notifying the public that it received final OMB approval on December 17, 2015, for the information collection requirements contained in the modifications to the Commission's rules in 47 CFR part 5. Under 5 CFR part 1320, an agency may not conduct or sponsor a collection of information unless it displays a current, valid OMB Control Number. No person shall be subject to any penalty for failing to comply with a collection of information subject to the Paperwork Reduction Act that does not display a current, valid OMB Control Number. The OMB Control Number is 3060–0065. The foregoing notice is required by the Paperwork Reduction Act of 1995, Public Law 104–13, October 1, 1995, and 44 U.S.C. 3507.

The total annual reporting burdens and costs for the respondents are as follows:

OMB Control Number: 3060–0065.

OMB Approval Date: December 17, 2015.

OMB Expiration Date: December 31, 2018.

Title: Radio Experimentation and Market Trials—Streamlining Rules.

Form Number: FCC Form 442.

Respondents: Business or other for-profit entities; not-for-profit institutions, and individuals or household.

Number of Respondents and Responses: 495 respondents; 560 responses.

Estimated Time per Response: 4 hours.

Frequency of Response: On-occasion reporting requirements; recordkeeping requirements; and third party disclosure.

Obligation to Respond: Required to obtain or retain benefits. The statutory authority for this information collection is contained in sections 47 U.S.C. Sections 4, 302, 303, 306, and 307 of the Communications Act of 1934, as amended.

Total Annual Burden: 3,049 hours.

Total Annual Cost: $41,600.

Nature and Extent of Confidentiality: There is no need for confidentiality, except for personally identifiable information individuals may submit, which is covered by a system of records, FCC/OET–1, ''Experimental Radio Station License Files,'' 71 FR 17234, April 6, 2006.

Privacy Act: No impact(s).

Needs and Uses: On January 31, 2013, the Commission adopted a Report and Order, in ET Docket No. 10–236 and 06–155; FCC 13–15, which updates part 5 of the CFR—''Experimental Radio Service'' (ERS). The Commission's recent Report and Order revises and streamlines rules for Experimental licenses. The new rules provide additional license categories to potential licensees. The new license categories are: (1) Program Experimental Radio License; (2) Medical Testing Experimental Radio License; and (3) Compliance Testing Experimental Radio License, including testing of radio frequency equipment in an Open Area Test Site.

Federal Communications Commission.

Sheryl Todd,

Deputy Secretary.

[Docket No. FWS–R5–ES–2011–0024; 4500030113]

RIN 1018–AY98

Endangered and Threatened Wildlife and Plants; 4(d) Rule for the Northern Long-Eared Bat

AGENCY: Fish and Wildlife Service, Interior.

ACTION: Final rule.

SUMMARY: We, the U.S. Fish and Wildlife Service (Service), finalize a rule under authority of section 4(d) of the Endangered Species Act of 1973 (Act), as amended, that provides measures that are necessary and advisable to provide for the conservation of the northern long-eared bat (*Myotis septentrionalis*), a bat species that occurs in 37 States, the District of Columbia, and 13 Canadian Provinces.

DATES: This rule is effective February 16, 2016.

ADDRESSES: This final 4(d) rule, the final environmental assessment, biological opinion, and list of references are available on the Internet at *http://www.regulations.gov* under Docket No. FWS–R5–ES–2011–0024 and at *http://www.fws.gov/midwest/Endangered.* Comments and materials we received, as well as supporting documentation we used in preparing this final 4(d) rule, are available for public inspection at *http://www.regulations.gov,* and by appointment, during normal business hours at: U.S. Fish and Wildlife Service, Twin Cities Ecological Services Field Office, 4101 American Blvd. East, Bloomington, MN 55425; telephone (612) 725–3548, ext. 2201; or facsimile (612) 725–3609.

FOR FURTHER INFORMATION CONTACT: Peter Fasbender, Field Supervisor, U.S. Fish and Wildlife Service, Twin Cities Ecological Services Field Office, 4101 American Blvd. East, Bloomington, MN 55425; telephone (612) 725–3548, ext. 2210; or facsimile (612) 725–3609. Persons who use a telecommunications device for the deaf (TDD) may call the Federal Information Relay Service (FIRS) at 800–877–8339.

SUPPLEMENTARY INFORMATION:

Executive Summary

The need for the regulatory action and how the action will meet that need: Consistent with section 4(d) of the Act, this final 4(d) rule provides measures that are tailored to our current understanding of the conservation needs of the northern long-eared bat.

On April 2, 2015, we published a document that is both a final rule to list the northern long-eared bat as a threatened species and an an interim 4(d) rule to provide measures that are necessary and advisable to provide for the conservation of the northern long-eared bat. At that time, we opened a 90-day public comment period on the interim rule, and we committed to publish a final 4(d) rule by December 31, 2015, and to complete review pursuant to the National Environmental Policy Act (NEPA). Previously, on January 16, 2015, we published a proposed 4(d) rule with a 60-day public comment period. Therefore,we have had two comment periods totaling 150 days on two versions of the 4(d) rule.

Statement of legal authority for the regulatory action: Under section 4(d) of the Act, the Secretary of the Interior has discretion to issue such regulations she deems necessary and advisable to provide for the conservation of the species. The Secretary also has the discretion to prohibit by regulation, with respect to a threatened species, any act prohibited by section 9(a)(1) of the Act.

Summary of the major provisions of the regulatory action: This final species-specific 4(d) rule prohibits purposeful take of northern long-eared bats throughout the species' range, except in instances of removal of northern long-eared bats from human structures, defense of human life (including public health monitoring), removal of hazardous trees for protection of human life and property, and authorized capture and handling of northern long-eared bats by individuals permitted to conduct these same activities for other

bats until May 3, 2016. After May 3, 2016, individuals who wish to capture and handle northern long-eared bats for recovery purposes will need a permit pursuant to section 10(a)(1)(A) of the Act.

Incidental take resulting from otherwise lawful activities will not be prohibited in areas not yet affected by white-nose syndrome (WNS). WNS is a fungal disease affecting many hibernating U.S. bat species. Ninety- to one-hundred-percent mortality has been seen in bats affected by the disease in the eastern United States.

Take of northern long-eared bats in their hibernacula (which includes caves, mines, and other locations where bats hibernate in winter) is prohibited in areas affected by WNS, unless permitted under section 10(a)(1)(A) of the Act. Take of northern long-eared bats inside of hibernacula may include disturbing or disrupting hibernating individuals when they are present as well as the physical or other alteration of the hibernaculum's entrance or environment when bats are not present if the result of the activity will impair essential behavioral patterns, including sheltering northern long-eared bats.

For northern long-eared bats outside of hibernacula, we have established separate prohibitions from take for activities involving tree removal and activities that do not involve tree removal. Incidental take of northern long-eared bats outside of hibernacula resulting from activities other than tree removal is not prohibited. Incidental take resulting from tree removal is prohibited if it: (1) Occurs within a 0.25 mile (0.4 kilometer) radius of known northern long-eared bat hibernacula; or (2) cuts or destroys known occupied maternity roost trees, or any other trees within a 150-foot (45-meter) radius from the known maternity tree during the pup season (June 1 through July 31). Incidental take of northern long-eared bats as a result of the removal of hazardous trees for the protection of human life and property is also not prohibited.

Peer review and public comment: We sought comments on our proposed 4(d) rule from independent specialists to ensure that this rule is based on scientifically sound data, assumptions, and analyses. We also considered all comments and information we received during the comment periods on the proposed and interim 4(d) rules.

Previous Federal Actions

Please refer to the proposed (78 FR 61046; October 2, 2013) and final (80 FR17974; April 2, 2015) listing rules for the northern long-eared bat for a detailed description of previous Federal actions concerning this species. On January 16, 2015, we published a proposed 4(d) rule (80 FR 2371) for the northern long-eared bat and on April 2, 2015, we published an interim 4(d) rule (80 FR 17974) for this species.

Background

The northern long-eared bat is a wide-ranging species that is found in a variety of forested habitats in summer and hibernates in caves, mines, and other locations in winter. WNS is the main threat to this species and has caused a precipitous decline in bat numbers (in many cases, 90–100 percent) where the disease has occurred. Declines in the numbers of northern long-eared bats are expected to continue as WNS extends across the species' range. For more information on the northern long-eared bat, its habitat, and WNS, please refer to the October 2, 2013, proposed listing (78 FR 61046) and the April 2, 2015, final listing (80 FR 17974) rules.

The Act (16 U.S.C. 1531 *et seq.*) does not specify particular prohibitions, or exceptions to those prohibitions, for threatened species. Instead, under section 4(d) of the Act, the Secretary of the Interior has the discretion to issue such regulations as she deems necessary and advisable to provide for the conservation of such species. The Secretary also has the discretion to prohibit by regulation, with respect to any threatened wildlife species, any act prohibited under section 9(a)(1) of the Act with respect to endangered species. Exercising this discretion under section 4(d) of the Act, the Service developed general prohibitions (50 CFR 17.31) and exceptions to those prohibitions (50 CFR 17.32) under the Act that apply to most threatened wildlife species.

In addition, for threatened species, under the authority of section 4(d) of the Act, the Service may develop prohibitions and exceptions that are tailored to the specific conservation needs of the species. In such cases, some of the prohibitions and authorizations under 50 CFR 17.31 and 17.32 may be appropriate for the species and be incorporated into a separate, species-specific, rule under section 4(d) of the Act. These rules will also include provisions that are tailored to the specific conservation needs of the threatened species and may be more or less restrictive than the general provisions at 50 CFR 17.31.

Definitions

This final rule uses several definitions and provisions contained in the Act and its implementing regulations.

The Act and its implementing regulations (50 CFR part 17) define take as harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct.

The term ''harass'' (50 CFR 17.3) means an intentional or negligent act or omission which creates the likelihood of injury to wildlife by annoying it to such an extent as to significantly disrupt normal behavioral patterns which include, but are not limited to, breeding, feeding, or sheltering.

The term ''harm'' (50 CFR 17.3) means an act which actually kills or injures wildlife. Such act may include significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding or sheltering.

''Purposeful take'' includes the capture and handling of individual bats. Take in this manner includes both capture and handling to remove bats from human structures and take that is for research purposes (*e.g.,* attaching a radiotracking device). Other purposeful take would include intentional removal of bats from hibernacula or the intentional killing or harassing of bats under any circumstance.

''Human structures'' are defined as houses, garages, barns, sheds, and other buildings designed for human entry.

''Incidental take'' is defined at 50 CFR 17.3 as any taking otherwise prohibited, if such taking is incidental to, and not the purpose of, an otherwise lawful activity. Examples of incidental take (or non-purposeful take as it is sometimes referred to in this rule) include land-management actions, such as implementation of forestry practices, where bats may be harmed, harassed, or killed as a result of those otherwise lawful actions. The actions contemplated in this rule include a wide range of actions for purposes such as right-of-way development and maintenance, forestry, land use for development unrelated to wildlife management, management of lands as habitats other than bat habitat (*e.g.,* prairie), energy production and transmission, and other activities.

Incidental take within the context of this rule is regulated in distinct and separate manners relative to the geographic location of the activity in question. For the purposes of this rule, we have developed a map associated with the occurrence and spread of WNS. This map will be updated by the first of each month as the disease spreads throughout the range of the species and

posted at *http://www.fws.gov/midwest/Endangered.*

''Known hibernacula'' are defined as locations where northern long-eared bats have been detected during hibernation or at the entrance during fall swarming or spring emergence.

''Known, occupied maternity roost trees'' are defined as trees that have had female northern long-eared bats or juvenile bats tracked to them or the presence of females or juveniles is known as a result of other methods.

''Tree removal'' is defined as cutting down, harvesting, destroying, trimming, or manipulating in any other way the trees, saplings, snags, or any other form of woody vegetation likely to be used by northern long-eared bats.

WNS Zone

The WNS zone, as mapped, provides the boundary for the distinction of implementation of this rule. To estimate the area impacted by WNS, we have used data on the presence of the fungus causing the disease, called *Pseudogymnoascus destructans,* or *Pd,* or evidence of the presence of the disease (WNS) in the bats within a hibernaculum. Our final listing determination provides additional information concerning *Pd* and WNS (80 FR 17993; April 2, 2015). Confirmed evidence of infection at a location within a county is mapped as a positive detection for the entire county. In addition, we have added a 150-mile (241-kilometer (km)) buffer to the *Pd*-positive county line to account for the spread of the fungus from one year to the next. In instances where the 150-mile (241-km) buffer line bisects a county, the entire county is included in the WNS zone.

Over the past 5 years, an average of 96 percent of the new *Pd* or WNS counties in any single year were within 150 miles (241 km) of a county that was *Pd*- or WNS-positive in a prior year (Service 2015, unpublished data). *Pd* is generally present for a year or two before symptoms of WNS appear and mortality of bats begins to occur. Given the relatively short amount of time between detection and population-level impacts, it is important that we protect those buffer areas and the bats within them with the same regulations as those in known WNS positive counties. Therefore, the positive counties, plus a buffer around them, are the basis for the WNS zone map.

Summary Comparison of the Interim 4(d) Rule and This Final Rule

Based on information we received in comment periods on the proposed and interim 4(d) rules (see Summary of Comments and Recommendations below), we revised the provisions of the interim 4(d) rule to better reflect the disproportionate effect that the disease, WNS, has had and will continue to have, we believe, on northern long-eared bat populations.

In the interim rule, we used the term ''white-nose syndrome buffer zone'' to identify ''the portion of the range of the northern long-eared bat'' within 150 miles (241 km) of the boundaries of U.S. counties or Canadian districts where the fungus *Pseudogymnoascus destructans (Pd)* or WNS had been detected. For purposes of clarification, in this final rule, we have changed the term ''white-nose syndrome buffer zone'' to ''white-nose syndrome zone'' or ''WNS zone.'' And we state that the ''WNS zone'' is ''the set of counties within the range of the northern long-eared bat'' within 150 miles (241 km) of the boundaries of U.S. counties or Canadian districts where *Pd* or WNS had been detected.

The interim 4(d) rule generally applies the prohibitions of 50 CFR 17.31 and 17.32 to the northern long-eared bat, which means that the interim rule, among other things, prohibits the purposeful take of northern long-eared bats throughout the species' range, but the interim rule includes exceptions to the purposeful take prohibition. The exceptions for purposeful take are: (1) In instances of removal of northern long-eared bats from human structures (if actions comply with all applicable State regulations); and (2) for authorized capture, handling, and related activities of northern long-eared bats by individuals permitted to conduct these same activities for other bat species until May 3, 2016. Under the interim rule, incidental take is not prohibited outside the WNS zone if the incidental take results from otherwise lawful activities. Inside the WNS zone, there are exceptions for incidental take for the following activities, subject to certain conditions: Implementation of forest management; maintenance and expansion of existing rights-of-way and transmission corridors; prairie management; minimal tree removal; and removal of hazardous trees for the protection of human life and property.

This final 4(d) rule does not generally apply the prohibitions of 50 CFR 17.31 to the northern long-eared bat. This rule continues to prohibit purposeful take of northern long-eared bats throughout the species' range, except in certain cases, including instances of removal of northern long-eared bats from human structures and for authorized capture, handling, and related activities of northern long-eared bats by individuals permitted to conduct these same activities for other bat species until May 3, 2016. After May 3, 2016, a permit pursuant to section 10(a)(1)(A) of the Act is required for the capture and handling of northern long-eared bats. Under this rule, incidental take is still not prohibited outside the WNS zone.

We have revised the interim rule's language concerning incidental take inside the WNS zone. Under this final rule, within the WNS zone, incidental take is prohibited only if: (1) Actions result in the incidental take of northern long-eared bats in hibernacula; (2) actions result in the incidental take of northern long-eared bats by altering a known hibernaculum's entrance or interior environment if the alteration impairs an essential behavioral pattern, including sheltering northern long-eared bats; or (3) tree-removal activities result in the incidental take of northern long-eared bats when the activity either occurs within 0.25 mile (0.4 kilometer) of a known hibernaculum, or cuts or destroys known occupied maternity roost trees, or any other trees within a 150-foot (45-meter) radius from the maternity roost tree, during the pup season (June 1 through July 31). Take of northern long-eared bats in their hibernacula may include disturbing or disrupting hibernating individuals when they are in the hibernacula. Take of northern long-eared bat also includes the physical or other alteration of the hibernaculum's entrance or environment when bats are not present if the result of the activity will impair essential behavioral patterns, including sheltering northern long-eared bats. Any take resulting from otherwise lawful activities outside known hibernacula, other than tree removal, is not prohibited, as long as it does not change the bat's access to or quality of a known hibernaculum for the species. This final rule makes these revisions because, in areas impacted by WNS, the most important conservation actions for the northern long-eared bat are to protect bats in hibernacula and maternity roost trees, and to continue to monitor populations in summer habitat (*e.g.,* identify where the species continues to survive after the detection of *Pd* or WNS and determine the factors influencing its resilience), while developing methods to abate WNS as quickly as possible.

Under this rule, we individually set forth prohibitions on possession and other acts with unlawfully taken northern long-eared bats, and on import and export of northern long-eared bats. These prohibitions were included in the interim 4(d) through the general application of the prohibitions of 50 CFR 17.31 to the northern long-eared bat. Under this rule, take of the northern

long-eared bat is also not prohibited for the following: Removal of hazardous trees for protection of human life and property; take in defense of life; and take by an employee or agent of the Service, of the National Marine Fisheries Service, or of a State conservation agency that is operating a conservation program pursuant to the terms of a cooperative agreement with the Service. Regarding these three exceptions, take in defense of life was not included in the interim 4(d) rule, but the other two exceptions were, either through the general application of 50 CFR 17.31 or through a specific exception included in the interim 4(d) rule.

Provisions of the 4(d) Rule for the Northern Long-Eared Bat

For a threatened species, the Act does not specify prohibitions, or exceptions to those prohibitions, relative to take of the species. Instead, under Section 4(d) of the Act, the Secretary has discretion to issue regulations deemed to be necessary and advisable for the conservation of a threatened species. By regulation, the Secretary has determined that take prohibitions for endangered species are also applicable to threatened species unless a special rule is issued under section 4(d) for a particular threatened species. Under this 4(d) rule, we have applied several of the prohibitions specified in the Act for endangered species and the provisions of 50 CFR 17.32 (permit regulations) to the northern long-eared bat as described below.

For this 4(d) rule, the Service has completed a biological opinion under Section 7 of the Act on our action of finalizing this rule. In addition, the biological opinion provides for streamlined consultation for all federal agency actions that may affect the northern long-eared bat; therefore, the scope of the biological opinion included the finalization and implementation of the 4(d) rule. The biological opinion resulted in a non-jeopardy determination. Provided Federal action agencies follow the criteria outlined in this rule and implement the streamlined consultation process outlined in the biological opinion, their section 7 consultation requirements will be met. If unable to follow these criteria, standard section 7 procedures will apply.

Exceptions to the Purposeful Take Prohibition

We have exempted the purposeful take of northern long-eared bats related to the protection of human health and safety. A very small percentage of bats may be infected with rabies or other diseases that can be transmissible to humans. When there is the possibility that a person has been exposed to a diseased bat, it is important that they coordinate with medical professionals (*e.g.,* doctor, local health department) to determine the appropriate response. When warranted to protect human health and safety, we have exempted from the take prohibition of northern long-eared bats in defense of one's own life or the lives of others, including for public health monitoring purposes (*i.e.,* collecting a bat after human exposure and submitting for disease testing).

We have also exempted the purposeful take of northern long-eared bats related to removing the species from human structures, but only if the actions comply with all applicable State regulations. Northern long-eared bats have occasionally been documented roosting in human-made structures, such as houses, barns, pavilions, sheds, cabins, and bat houses (Mumford and Cope 1964, p. 480; Barbour and Davis 1969, p. 77; Cope and Humphrey 1972, p. 9; Amelon and Burhans 2006, p. 72; Whitaker and Mumford 2009, p. 209; Timpone et al. 2010, p. 119; Joe Kath 2013, pers. comm.). We conclude that the overall impact of bat removal from human structures is not expected to adversely affect conservation and recovery efforts for the species. In addition, we provide the following recommendations:

- Minimize use of pesticides (*e.g.,* rodenticides) and avoid use of sticky traps as part of bat evictions/exclusions.
- Conduct exclusions during spring or fall unless there is a perceived public health concern from bats present during summer and/or winter.
- Contact a nuisance wildlife specialist for humane exclusion techniques.

We have exempted the purposeful take that results from actions relating to capture, handling, and related activities for northern long-eared bats by individuals permitted to conduct these same activities for other species of bats until May 3, 2016. Under the interim rule, for a period of 1 year from the interim rule's effective date (May 3, 2016), we had exempted the purposeful take that is caused by the authorized capture, handling, and related activities (*e.g.,* attachment of radio transmitters for tracking) of northern long-eared bats by individuals permitted to conduct these same activities for other bats. We have continued the exemption through the expiration date established by the interim rule. After May 3, 2016, a permit pursuant to section 10(a)(1)(A) of the Act is required for the capture and handling of northern long-eared bats,except that associated with bat removal from human structures. We determined that it was important to regulate the intentional capture and handling of northern long-eared bats through the Act's scientific permit process to help ensure that the surveyor's qualifications and methods used are adequate to protect individual bats and provide reliable survey results.

Incidental Take Outside of the WNS Zone Not Prohibited

Incidental take in areas that have not yet been impacted by WNS (*i.e.,* in areas outside the WNS zone) is not prohibited by this final rule. We believe the level of take associated with on-going land management and development actions, including all actions that may incidentally take the northern long-eared bat, do not individually or cumulatively affect healthy bat populations. As noted in our decision to list the northern long-eared bat as a threatened species, WNS is the primary cause of the species' decline, and we would not have listed the northern long-eared bat if not for the impact of WNS. In addition, we conclude that regulating incidental take in areas not affected by WNS is not expected to change the rate at which WNS progresses across the range of the species. In other words, regulating incidental take outside the WNS zone will not influence the future impact of the disease throughout the species' range or the status of the species. For these reasons, we have concluded that the prohibition of incidental take outside of the WNS zone is not necessary and advisable for the protection and recovery of the species. Incidental take, therefore, is not prohibited outside of the WNS zone.

Prohibitions and Exemptions Related to Incidental Take Inside the WNS Zone

Our approach to designing the regulatory provisions for the northern long-eared bat inside the WNS zone reflects the significant role WNS plays as the central threat affecting the species. For other threatened species, habitat loss or other limiting factors usually contribute to the decline of a species. In these situations, regulations are needed to address either the habitat loss or the other limiting factors.

The northern long-eared bat is not habitat-limited and has demonstrated a great deal of plasticity within its environment (*e.g.,* living in highly fragmented forest habitats to contiguous forest blocks from the southern United States to Canada's Yukon Territory) in the absence of WNS. For the northern long-eared bat, land management and

development actions that have been ongoing for centuries (*e.g.,* forest management, forest conversion) have not been shown to have significant negative impacts to northern long-eared bat populations.

As WNS continues to move across the range of the species, northern long-eared bat populations have declined and will continue to decline. Declines in northern long-eared bat populations in WNS-positive regions have been significant, and northern long-eared bats are now relatively rare on those landscapes. As populations decline as a result of WNS, the chances of any particular activity affecting northern long-eared bats becomes more remote. Therefore, in the WNS zone, we focused the regulatory provisions on sensitive life stages at known, occupied maternity roost trees and hibernacula.

We developed regulations that provide some level of protection to the species where it persists in the face of WNS. However, we have provided flexibility so that the regulated public will seek to conserve the species and foster its recovery at sites where it has been lost should tools to address WNS become available or where the species shows signs of resilience. Further, because we believe recovery of this species will require many partnerships across the species' range, minimizing regulatory impacts on activities inconsequential to northern long-eared bat populations provides an important step in building partnerships for the species' recovery.

The northern long-eared bat is a forest-dependent species, typically roosting in trees. In establishing regulations that are necessary and advisable for the conservation of the species, we have tailored species-specific regulatory provisions toward potential impacts to trees. For the incidental take of bats outside of hibernacula, we have specifically established two sets of provisions: the first set applies to activities that do not involve tree removal and the second applies to activities that do involve tree removal. By tree removal, we mean cutting down, harvesting, destroying, trimming, or manipulating in any other way the trees, saplings, snags, or any other form of woody vegetation that is likely to be used by the northern long-eared bat.

In this final 4(d) rule, we have limited the prohibition of incidental take of northern long-eared bats to specific circumstances. This does not mean that all activities that could result in the incidental take of the northern long-eared bat will do so. The relative exposure of the species and the species response to a potential stressor are critical considerations in evaluating the potential for incidental take to occur. For example, under the discussion of tree removal, below, we describe what is prohibited by the final 4(d) rule in the WNS zone and provide examples of how other activities could be implemented in a way that avoids the potential for incidental take.

Hibernacula

Northern long-eared bats predominantly overwinter in hibernacula that include caves and abandoned mines. For additional details about the characteristics of the hibernacula selected by northern long-eared bats, see the final listing determination (80 FR 17974; April 2, 2015). Northern long-eared bats have shown a high degree of philopatry (using the same site over multiple years) for a hibernaculum (Pearson 1962, p. 30), although they may not return to the same hibernaculum in successive seasons (Caceres and Barclay 2000, p. 2).

Hibernacula are so significant to the northern long-eared bat that they are considered a primary driver in the species distribution (*e.g.,* Kurta 1982, p. 302). Northern long-eared bats are documented in hibernacula in 29 of the 37 states in the species' range. Other States within the species' range have no known hibernacula, which may reflect that no suitable hibernacula are present, a limited survey effort, or the northern long-eared bat's use of sites not previously identified as suitable.

In general, bats select hibernacula because they have characteristics that allow the bats to meet specific life-cycle requirements. Factors influencing a hibernaculum's suitability include its physical structure (*e.g.,* openings, interior space, depth), air circulation, temperature profile, and location relative to foraging sites (Tuttle and Stevenson 1978, pp. 108–121).

Overwinter survival can be a particularly challenging period in the northern long-eared bat's life cycle. Hibernating bats appear to balance their physical condition (*e.g.,* fat reserves upon entering hibernation), hibernacula characteristics (*e.g.,* temperature variation, humidity), social resources (*e.g.,* roosting singly or in groups), and metabolic condition (*i.e.,* degree of torpor, which is the state of mental or physical inactivity) to meet overwinter survival needs. The overwinter physiological needs of the species include maintaining body temperature above freezing, minimizing water loss, meeting energetic needs until prey again become available, and responding to disturbance or disease. Because of this complex interplay of hibernacula characteristics and bat physiology, changes to hibernacula can significantly impact their suitability as well as the survival of any hibernating bats.

In general, northern long-eared bats arrive at hibernacula in August or September, enter hibernation in October and November, and emerge from the hibernacula in March or April (Caire et al. 1979, p. 405; Whitaker and Hamilton 1998, p. 100; Amelon and Burhans 2006, p. 72). However, hibernation may begin as early as August (Whitaker and Rissler 1992b, p. 56). Northern long-eared bats have been observed moving among hibernacula throughout the winter (Griffin 1940a, p. 185; Whitaker and Rissler 1992a, p. 131; Caceres and Barclay 2000, pp. 2–3). Whitaker and Mumford (2009, p. 210) found that this species flies in and out of some mines and caves in southern Indiana throughout the winter.

Human disturbance of hibernating bats has long been considered a threat to cave-hibernating bat species like the northern long-eared bat. Modifications to bat hibernacula can affect the microclimate (*e.g.,* temperature, humidity) of the subterranean habitat, and thus the ability of the cave or mine to support hibernating bats, including the northern long-eared bat. Anthropogenic modifications to cave and mine entrances may not only alter flight characteristics and access (Spanjer and Fenton 2005, p. 1110), but may change airflow and alter internal microclimates of the caves and mines, eliminating their utility as hibernacula (Service 2007, p. 71). For example, Richter et al. (1993, p. 409) attributed the decline in the number of Indiana bats at Wyandotte Cave, Indiana (which harbors one of the largest known population of hibernating Indiana bats (*Myotis sodalis*)), to an increase in the cave's temperature resulting from restricted airflow caused by a stone wall erected at the cave's entrance. In addition to the direct access modifications to caves discussed above, debris buildup at entrances or on cave gates can also significantly modify the cave or mine site characteristics by restricting airflow and the course of natural water flow. Water-flow restriction could lead to flooding, thus drowning hibernating bats (Amelon and Burhans 2006, p. 72). Thomas (1995, p. 942) used infrared detectors to measure flight activity in hibernating northern long-eared bats and little brown bats in response to the presence of a human observer. Flight activity significantly increased with the presence of an observer, beginning within 30 minutes

of the visit, peaking 1.0 to 7.5 hours later, and remaining significantly above baseline level for 2.5 to 8.5 hours. These results suggest that hibernating bats are sensitive to non-tactile stimuli and arouse and fly following human visits. Boyles and Brack's (2009) model predicted that the survival rate of hibernating little brown bats drops from 96 percent to 73 percent with human visitations to hibernacula. Prior to the outbreak of WNS, Amelon and Burhans (2006, p. 73) indicated that ''the widespread recreational use of caves and indirect or direct disturbance by humans during the hibernation period pose the greatest known threat to [the northern long-eared bat].''

Hibernacula and surrounding forest habitats play important roles in the life cycle of the northern long-eared bat beyond the time when the bats are overwintering. In both the early spring and fall, the hibernacula and surrounding forested habitats are the focus of bat activity in two separate periods referred to as ''spring staging'' and ''fall swarming.''

During the spring staging, bats begin to gradually emerge from hibernation, exit the hibernacula to feed, but re-enter the same or alternative hibernacula to resume daily bouts of torpor (Whitaker and Hamilton 1998, p. 100). The staging period for the northern long-eared bat is likely short in duration (Whitaker and Hamilton 1998, p. 100; Caire et al. 1979, p. 405). In Missouri, Caire et al. (1979, p. 405) found that northern long-eared bats moved into the staging period in mid-March through early May. In Michigan, Kurta et al. (1997, p. 478) determined that by early May, two-thirds of the *Myotis* species, including the northern long-eared bat, had dispersed to summer habitat.

Beginning in mid to late summer, after their young have gained some level of independence, northern long-eared bats exhibit a behavior near hibernacula referred to as swarming. Both male and female northern long-eared bats are present at swarming sites (often with other species of bats). During this period, heightened activity and congregation of transient bats around caves and mines is observed, followed later by increased sexual activity and bouts of torpor prior to winter hibernation (Fenton 1969, p. 601; Parsons et al. 2003, pp. 63–64; Davis and Hitchcock 1965, pp. 304–306). The purposes of swarming behavior may include introduction of juveniles to potential hibernacula, copulation, and stopping over sites on migratory pathways between summer and winter regions (Kurta et al. 1997, p. 479; Parsons et al. 2003, p. 64; Lowe 2012, p. 51; Randall and Broders 2014, pp. 109–110). The swarming season for some species of the genus *Myotis* begins shortly after females and young depart maternity colonies (Fenton 1969, p. 601). For the northern long-eared bat, the swarming period may occur between July and early October, depending on latitude within the species' range (Fenton 1969, p. 598; Kurta et al. 1997, p. 479; Lowe 2012, p. 86; Hall and Brenner 1968, p. 780; Caire et al. 1979, p. 405). The northern long-eared bat may investigate several cave or mine openings during the transient portion of the swarming period, and some individuals may use these areas as temporary daytime roosts or may roost in forest habitat adjacent these sites (Kurta et al. 1997, pp. 479, 483; Lowe 2012, p. 51). Little is known about northern long-eared bat roost selection outside of caves and mines during the swarming period (Lowe 2012, p. 6).

Based on the importance of hibernacula to northern long-eared bats, take is prohibited in and around the hibernacula within the WNS zone, including activities that may alter the hibernacula at any time of the year. Further, we have determined that when the conservation measures for the northern long-eared bat included in this final 4(d) rule are applied to areas within 0.25 mile (0.4 km) of the hibernacula, the potential for negative impacts to individuals is significantly reduced.

Activities Not Involving Tree Removal Are Not Prohibited

Under this final 4(d) rule, activities within the WNS zone not involving tree removal are not prohibited provided they do not result in the incidental take of northern long eared bats in hibernacula or otherwise impair essential behavioral patterns at known hibernacula. In our final listing determination (80 FR 17974; April 2, 2015), we identified a number of activities not involving tree removal that may have direct or indirect effects on northern long-eared bats. These activities have the potential to cause the incidental take of northern long-eared bats and include activities such as the operation of utility-scale wind-energy turbines, application of pesticides, and prescribed fire (this is not an exhaustive list; it is merely representative of activities that may result in take of northern long-eared bats).

At the time of our listing determination and the interim 4(d) rule (80 FR 17974; April 2, 2015), we stated that we had no compelling evidence that these activities would have significant effects on the northern long-eared bat when considered alone. However, we thought these factors may have a cumulative effect on this species when considered in concert with WNS. After additional consideration and our review of public comments received on the proposed and interim 4(d) rules, we did not find compelling evidence that regulating these potential cumulative effects would result in significant impacts at the species level. Effects to relatively small numbers of individuals are not anticipated to impair conservation efforts or the recovery potential of the species.

Wind-Energy Facilities

Wind-energy facilities are found scattered throughout the range of the northern long-eared bat, and many new facilities are anticipated to be constructed over the next 15 years (United States Department of Energy 2008, unpaginated). We reviewed post-construction mortality monitoring studies conducted at various times from 1998 through 2014 at 81 unique operating wind-energy facilities in the range of the northern long-eared bat in the United States and Canada (Service 2015, unpublished data). In these studies, 43 northern long-eared bat mortalities were documented at 19 of the sites. The northern long-eared bat fatalities comprised less than 1 percent of all documented bat mortalities. In most cases, the level of effort for most post-construction monitoring studies is not sufficient to confidently exclude the possibility that infrequent fatalities are being missed, but finding none or only small numbers over many sites and years can suggest the order of what may be missed. Thus while sustained mortality at particular facilities could potentially cause declines in local populations of the northern long-eared bat, if that is in fact occurring, it does not appear to be wide-spread at least when compared to other bat species which are nearly always found in fatality monitoring at wind facilities. At those sites with a northern long-eared bat fatality where multiple years of monitoring data were also available for review (n = 12), fatalities of northern long-eared bats were only reported in multiple years at two of the sites and for the other 10 sites only a single fatality was reported over multiple years of monitoring. For example, one site reported one northern long-eared bat fatality in 2008, but none in 2009, 2010, or 2011. Further, the number of fatalities of northern long-eared bats found at any given site has been relatively small (*e.g.,* most often a single fatality was found, but in all cases no more than six), and typically most sites (62 out of 81) found

no northern long-eared bat fatalities at all. There is a great deal of uncertainty related to extrapolating these numbers to generate an estimate of total northern long-eared bat mortality at wind-energy facilities due to variability in post-construction survey effort and methodology (Huso and Dalthorp 2014, pp. 546–547). Further, bat mortality can vary between years and between sites, and detected carcasses are only a small percentage of total bat mortalities. However, even with those limitations, northern long-eared bats were rarely detected as mortalities, even when they were known to be common on the landscape around the wind-energy facility.

We recognize that several wind energy facilities have completed, or are currently working to complete, habitat conservation plans (HCPs; permit pursuant to section 10(a)(1)(B) of the Act) for other listed bat species where the number of fatalities reported is also very low. When the take of an endangered species is reasonably certain to occur, we recommend that a project proponent secure incidental take coverage pursuant to section 10 of the Act. Over the operational life of a wind energy facility (typically anticipated to be at least 20 to 30 years), the take of listed species may be reasonably certain to occur, even if the level of mortalities annually is anticipated to be quite low. However, this does not mean that prohibiting that incidental take in the case of a threatened species is necessary and advisable for the conservation of such a species. For the northern long-eared bat, we do not anticipate that the fatalities that will be caused by wind energy would meaningfully change the species' status in the foreseeable future.

In addition, the wind industry has recently published best management practices establishing voluntary operating protocols, which they expect ''to reduce impacts to bats from operating wind turbines by as much as 30 percent'' (AWEA 2015, unpaginated). Given the large numbers of other bat species impacted by wind energy (Hein et al. 2013, p. 12) and the economic importance of bats in controlling agricultural or forest pest species (Boyles et al. 2011, pp. 41–42; Maine and Boyles, 2015, p. 12442), we anticipate that these new standards will be adopted by the wind-energy sector and ultimately required by wind-energy-siting regulators at State and local levels. We recommend that wind facilities adopt these operating protocols.

Our primary reason for not establishing regulatory criteria for wind-energy facilities is that the best available information does not indicate significant impacts to northern long-eared bats from such operations. We conclude that there may be adverse effects posed by wind-energy development to individual northern long-eared bats; however, there is no evidence suggesting that effects from wind-energy development has led to significant declines in this species, nor is there evidence that regulating the incidental take that is occurring would meaningfully change the conservation or recovery potential of the species in the face of WNS. Furthermore, with the adoption by wind-energy facilities of the new voluntary standards, risk to all bats, including the northern long-eared bat, should be further reduced.

Environmental Contaminants

Environmental contaminants, in particular insecticides, pesticides, and inorganic contaminants, such as mercury and lead, may also have detrimental effects on individual northern long-eared bats. However, across the wide-range of the species, it is unclear whether environmental contaminants, regardless of the source (*e.g.,* pesticide applications, industrial waste-water), would be expected to cause population-level impacts to the northern long-eared bat either independently or in concert with WNS. Historically, the most intensively-studied contaminants in bats have been the organochlorine insecticides (OCs; O'Shea and Clark 2002, p. 238). During wide-spread use of OCs in the 1960s and 1970s, lethal pesticide poisoning was demonstrated in gray bats (*Myotis grisescens*), Mexican free-tailed bats (*Tadarida brasiliensis*), and Indiana bats (*Myotis sodalis*) (O'Shea and Clark 2002, p. 239, 242). Since the phasing out of OCs in the United States, the effects of chemical contaminants on bats have been less well studied (O'Shea and Johnston 2009, p. 501); however, a few recent studies have demonstrated the accumulation of potentially toxic elements and chemicals in North American bats. For instance, Yates et al. (2014, pp. 48–49) quantified total mercury (Hg) levels in 1,481 fur samples and 681 blood samples from 10 bat species captured across 8 northeastern U.S. States and detected the highest Hg levels in tri-colored bats (*Perimyotis subflavus*), little brown bats (*Myotis lucifugus*) and northern long-eared bats. More recently, Secord et al. (2015) analyzed tissue samples from 48 northeastern bat carcasses of four species, including northern long-eared bats, and detected accumulations of several contaminants of emerging concern (CECs), including most commonly polybrominated diphenyl ethers (PDBEs; 100 percent of samples), salicylic acid (81 percent), thiabendazole (50 percent), and caffeine (23 percent). Digoxigenin, ibuprofen, warfarin, penicillin V, testosterone, and N,N-diethyl-meta-toluamide (DEET) were also present in at least 15 percent of samples. Compounds with the highest concentrations were bisphenol A (397 ng/g), PDBE congeners 28, 47, 99, 100, 153, and 154 (83.5 ng/g), triclosan (71.3 n/g), caffeine (68.3 ng/g), salicylic acid (66.4 ng/g), warfarin (57.6 ng/g), sulfathiazole (55.8 ng/g), tris(1-chloro-2-propyl) phosphate (53.8 ng/g), and DEET (37.2 ng/g).

Although there is the potential for direct and indirect contaminant-related effects, mortality or other population-level impacts have not been reported for northern long-eared bats. Long-term sublethal effects of environmental contaminants on bats are largely unknown; however, environmentally relevant exposure levels of various contaminants have been shown to impair nervous system, endocrine, and reproductive functioning in other wildlife (Yates et al. 2014, p. 52; Köhler and Triebskorn 2013, p. 761; Colborn et al. 1993, p. 378). Moreover, bats' high metabolic rates, longevity, insectivorous diet, migration-hibernation patterns of fat deposition and depletion, and immune impairment during hibernation, along with potentially exacerbating effects of WNS, likely increase their risk of exposure to and accumulation of environmental toxins (Secord et al. 2015, p. 411, Yates et al. 2014, p. 46, Geluso et al. 1976, p. 184; Quarles 2013, p. 4, O'Shea and Clark 2002, p. 238). Following WNS-caused population declines in northeastern little brown bats, Kannan et al. (2010) investigated whether exposure to toxic contaminants could be a contributing factor in WNS-related mortality. Although high concentrations of polychlorinated biphenyls (PCBs), PBDEs, polybrominated biphenyls (PBBs), and chlordanes were found in the fat tissues of WNS-infected bats in New York, relative concentrations in bats from an uninfected population in Kentucky were also high (Kannan et al. 2010, p. 615). The authors concluded that the study's sample sizes were too small to accurately associate contaminant exposure with the effects of WNS in bats (Kannan et al. 2010, p. 618), but argued that additional research is needed. Despite the lack of knowledge on the effects of various contaminants on northern long-eared bats, we recognize the potential for direct and indirect consequences.

However, contaminant-related mortality has not been reported for northern long-eared bats. Additionally, Ingersoll (2013, p. 9) suggested it was unclear what other threats or combination of threats other than WNS (*e.g.,* changes to critical roosting or foraging habitat, collisions, effects from chemicals) may be responsible for recent bat declines.

Prescribed Fire

Prescribed fire is a useful forest-management tool. However, there are potential negative effects from prescribed burning, including direct mortality to the northern long-eared bat. Therefore, when using prescribed burning as a management tool, fire frequency, timing, location, and intensity all need to be considered to lower the risk of incidental take of bats. Carter et al. (2002, pp. 140–141) suggested that the risk of direct injury and mortality to southeastern forest-dwelling bats resulting from summer prescribed fire is generally low. During warm temperatures, bats are able to arouse from short-term torpor quickly. Northern long-eared bats use multiple roosts, switch roost trees often, and could likely use alternative roosts in unburned areas, should fire destroy the current roost. Non-volant pups are likely the most vulnerable to death and injury from fire. Although most eastern bat species are able to carry their young for some time after they are born (Davis 1970, pp. 187–189), the degree to which this behavior would allow females to relocate their young if fire threatens the nursery roost is unknown. The potential for death or injury resulting from prescribed burning depends largely on site-specific circumstances, *e.g.,* fire intensity near the maternity roost tree and the height above ground of pups in the maternity roost tree. Not all fires through maternity roosting areas will kill or injure all pups present.

Bats are known to take advantage of fire-killed snags and continue roosting in burned areas. Boyles and Aubrey (2006, pp. 111–112) found that, after years of fire suppression, initial burning created abundant snags, which evening bats (*Nycticeius humeralis*) used extensively for roosting. Johnson et al. (2010, pp. 115) found that after burning, male Indiana bats roosted primarily in fire-killed maples. In the Daniel Boone National Forest, Lacki et al. (2009, p. 5) radio-tracked adult female northern long-eared bats before and after prescribed fire, finding more roosts (74.3 percent) in burned habitats than in unburned habitats. Burning may create more suitable snags for roosting through exfoliation of bark (Johnson et al. 2009a, p. 240), mimicking trees in the appropriate decay stage for roosting bats. In addition to creating snags and live trees with roost features, prescribed fire may enhance the suitability of trees as roosts by reducing adjacent forest clutter. Perry et al. (2007, p. 162) found that five of six species, including northern long-eared bat, roosted disproportionately in stands that were thinned and burned 1 to 4 years prior but that still retained large overstory trees.

The use of prescribed fire, where warranted, will, in any given year, impact only a small proportion of the northern long-eared bat's range during the bats active period. In addition, there are substantial benefits of prescribed fire for maintaining forest ecosystems. For example, the U.S. Forest Service's Southern Region manages approximately 10.9 million acres (4.4 million hectares (ha)) of land, and the maximum estimate of acres where prescribed fire is employed annually during the active period of northern-long eared bats (April through October) was 320,577 acres (129,732 ha), which is less than 3 percent of the National Forest regional lands. Similarly, the Forest Service's Eastern Region manages 15 Forests in 13 States that include about 12.2 million acres (4.88 million ha), of which 11.3 million acres (4.52 million ha) are forested habitat. The U.S. Forest Service anticipates applying prescribed burning to 107,684 acres (43,073 ha) or about 1percent of the forested habitat across the eastern region annually. In addition, only 17,342 acres (6937 ha) (*i.e.,* 0.15 percent of the forested habitat) of prescribed burning annually is anticipated to occur during the non-volant period on the eastern forests.

Further, there are substantial benefits of prescribed fire for maintaining forest ecosystems, such as providing the successional and disturbance processes that renew the supply of suitable roost trees (Silvis et. al. 2012, pp.6–7), as well as helping to ensure a varied and reliable prey base (Dodd et. al. 2012, p. 269). There is no evidence that prescribed fire has led to population-level declines in this species nor is there evidence that regulating the incidental take that might occur would meaningfully change the conservation status or recovery potential of the species in the face of WNS.

Hazardous Tree Removal Is Not Prohibited

Under this final 4(d) rule, incidental take that is caused by removal and management of hazardous trees is not prohibited. The removal of these hazardous trees may be widely dispersed, but limited, and should result in very minimal incidental take of northern long-eared bats. We recommend, however, that removal of hazardous trees be done during the winter, wherever possible, when these trees will not be occupied by northern long-eared bats. We conclude that the overall impact of removing hazardous trees is not expected to adversely affect conservation and recovery efforts for the species.

Activities Involving Tree Removal

We issued the interim species-specific rule under section 4(d) of the Act in recognition that WNS is the primary threat to the species' continued existence. We further recognized that all other (non-WNS) threats cumulatively were not impacting the species at the population level. Therefore, we apply the take prohibitions only to activities that we have determined may impact the species in its most vulnerable life stages, allowing for management flexibility and a limited regulatory burden.

In this final 4(d) rule, we have determined that the conservation of the northern long-eared bat is best served by limiting the prohibitions to the most vulnerable life stages of the northern long-eared bat (*i.e.,* while in hibernacula or in maternity roost trees) within the WNS zone and to activities, tree removal in particular, that are most likely to affect the species. We have also revised some of the conservation measures. To further simplify the regulation, we have established separate prohibitions for activities involving tree removal and those that do not involve tree removal. Within the WNS zone incidental take outside of hibernacula that results from tree removal is only prohibited when it (1) Occurs within 0.25 miles (0.4 km) of known northern long-eared bat hibernacula; or (2) cuts or destroys known occupied maternity roost trees, or any other trees within a 150-foot (45-meter) radius from the known occupied maternity trees, during the pup season (June 1 through July 31).

Forest Management

Forest management maintains forest habitat on the landscape, and the impacts from management activities are, for the most part, temporary in nature. Forest management is the practical application of biological, physical, quantitative, managerial, economic, social, and policy principles to the regeneration, management, utilization, and conservation of forests to meet specified goals and objectives (Society of American Foresters, *http://dictionaryofforestry.org/dict/term/forest_*

management). It includes a broad range of silvicultural practices and this discussion specifically addresses tree-removal practices (*e.g.,* timber harvest) associated with forest management. Timber harvesting includes a wide variety of practices from selected removal of individual trees to clearcutting. Impacts to northern long-eared bats from forest management would be expected to range from positive (*e.g.,* maintaining or increasing suitable roosting and foraging habitat within northern long-eared bat home ranges) to neutral (*e.g.,* minor amounts of forest removal, forest management in areas outside northern long-eared bat summer home ranges, forest management away from hibernacula) to negative (*e.g.,* death of adult females or pups or both resulting from the removal of maternity roost trees).

The best available data indicate that the northern long-eared bat shows a varied degree of sensitivity to timber-harvesting practices. For example, Menzel et al. (2002, p. 112) found northern long-eared bats roosting in intensively managed stands in West Virginia, indicating that there were sufficient suitable roosts (primarily snags) remaining for their use. At the same study site, Owen et al. (2002, p. 4) concluded that northern long-eared bats roosted in areas with abundant snags, and that in intensively managed forests in the central Appalachians, roost availability was not a limiting factor. Northern long-eared bats often chose black locust and black cherry as roost trees, which were quite abundant and often regenerate quickly after disturbance (*e.g.,* timber harvest). Similarly, Perry and Thill (2007, p. 222) tracked northern long-eared bats in central Arkansas and found roosts were located in eight forest classes with 89 percent occurring in three classes of mixed pine-hardwood forest. The three classes of mixed pine-hardwood forest that supported the majority of the roosts were partially harvested/thinned, unharvested (50 to 99 years old), and group-selection harvested (Perry and Thill 2007, pp. 223–224).

Certain levels of timber harvest may result in canopy openings, which could result in more rapid development of young bats. In central Arkansas, Perry and Thill (2007, pp. 223–224) found female bat roosts were more often located in areas with partial harvesting than males, with more male roosts (42 percent) in unharvested stands than female roosts (24 percent). They postulated that females roosted in relatively more open forest conditions because they may receive greater solar radiation, which may increase developmental rates of young or permit young bats a greater opportunity to conduct successful initial flights (Perry and Thill 2007, p. 224). Cryan et al. (2001, p. 49) found several reproductive and non-reproductive female northern long-eared bat roost areas in recently harvested (less than 5 years) stands in the Black Hills of South Dakota in which snags and small stems (diameter at breast height (dbh)) of 2 to 6 inches (5 to 15 centimeters) were the only trees left standing; however, the largest colony (n = 41) was found in a mature forest stand that had not been harvested in more than 50 years.

Forest size and continuity are also factors that define the quality of habitat for roost sites for northern long-eared bats. Lacki and Schwierjohann (2001, p. 487) stated that silvicultural practices could meet both male and female roosting requirements by maintaining large-diameter snags, while allowing for regeneration of forests. Henderson et al. (2008, p. 1825) also found that forest fragmentation affects northern long-eared bats at different scales based on sex; females require a larger unfragmented area with a large number of suitable roost trees to support a colony, whereas males are able to use smaller, more fragmented areas. Henderson and Broders (2008, pp. 959–960) examined how female northern long-eared bats use the forest-agricultural landscape on Prince Edward Island, Canada, and found that bats were limited in their mobility and activities are constrained when suitable forest is limited. However, they also found that bats in a relatively fragmented area used a building for colony roosting, which suggests an alternative for a colony to persist in an area with fewer available roost trees.

In addition to impacts on roost sites, we considered effects of forest-management practices on foraging and traveling behaviors of northern long-eared bats. In southeastern Missouri, the northern long-eared bat showed a preference for contiguous tracts of forest cover (rather than fragmented or wide open landscapes) for foraging or traveling, and different forest types interspersed on the landscape increased likelihood of occupancy (Yates and Muzika 2006, p. 1245). Similarly, in West Virginia, female northern long-eared bats spent most of their time foraging or travelling in intact forest, diameter-limit harvests (70 to 90 year-old stands with 30 to 40 percent of basal area removed in the past 10 years), and road corridors, with no use of deferment harvests (similar to clearcutting) (Owen et al. 2003, p. 355). When comparing use and availability of habitats, northern long-eared bats preferred diameter-limit harvests and forest roads. In Alberta, Canada, northern long-eared bats avoided the center of clearcuts and foraged more in intact forest than expected (Patriquin and Barclay 2003, p. 654). On Prince Edward Island, Canada, female northern long-eared bats preferred open areas less than forested areas, with foraging areas centered along forest-covered creeks (Henderson and Broders 2008, pp. 956–958). In mature forests in South Carolina, 10 of the 11 stands in which northern long-eared bats were detected were mature stands (Loeb and O'Keefe 2006, p. 1215). Within those mature stands, northern long-eared bats were more likely to be recorded at points with sparse or medium vegetation rather than points with dense vegetation, suggesting that some natural gaps within mature forests can provide good foraging habitat for northern long-eared bats (Loeb and O'Keefe 2006, pp. 1215–1217). However, in southwestern North Carolina, Loeb and O'Keefe (2011, p. 175) found that northern long-eared bats rarely used forest openings, but often used roads. Forest trails and roads may provide small gaps for foraging and cover from predators (Loeb and O'Keefe 2011, p. 175). In general, northern long-eared bats appear to prefer intact mixed-type forests with small gaps (*i.e.,* forest trails, small roads, or forest-covered creeks) in forest with sparse or medium vegetation for forage and travel rather than fragmented habitat or areas that have been clearcut.

Impacts to northern long-eared bats from forest management would be expected to vary depending on the timing of tree removal, location (within or outside northern long-eared bat home range), and extent of removal. While bats can flee during tree removal, removal of occupied roosts (during spring through fall) may result in direct injury or mortality to some percentage of northern long-eared bats. This percentage would be expected to be greater if flightless pups or inexperienced flying juveniles were also present. Forest management outside of northern long-eared bat summer home ranges or away from hibernacula would not be expected to affect the conservation of the species.

Forest management is not usually expected to result in a permanent loss of suitable roosting or foraging habitat for northern long-eared bats. On the contrary, forest management is expected to maintain a forest over the long term for the species. However, localized temporary reductions in suitable roosting and/or foraging habitat can occur from various forest practices (*e.g.,*

clearcuts). As stated above, northern long-eared bats have been found in forests that have been managed to varying degrees, and as long as there is sufficient suitable roosting and foraging habitat within their home range and travel corridors between those areas, we would expect northern long-eared bat colonies to continue to occur in managed landscapes. However, in areas with WNS, northern long-eared bats may be less resilient to stressors and maternity colonies are smaller. Given the low inherent reproductive potential of northern long-eared bats (one pup per female per year), death of adult females or pups or both during tree felling could reduce the long-term viability of some of the WNS-impacted colonies if they are also in the relatively small percentage of forest habitat directly affected by forest management.

As we documented in the interim 4(d) rule, forestry management and silviculture are vital to the long-term survival and recovery of the species. Based on information obtained during comment periods, approximately 2 percent of forests in States within the range of the northern long-eared bat are impacted by forest management activities annually (Boggess et al., 2014, p.9). Of this amount, in any given year, a smaller fraction of forested habitat would be impacted during the active season when female bats and pups are most vulnerable. Therefore, we have determined that when the prohibitions for the northern long-eared bat included in this final 4(d) rule are applied to forest management activities, the potential impacts will be significantly reduced.

Forest Conversion

In our listing determination for the northern long-eared bat, we noted that current and future forest conversion may have negative additive impacts where the species has been impacted by WNS (80 FR 17991; April 2, 2015). Our assessment was based largely on the species' summer-home-range fidelity and the potential for increased energetic demands for individuals where the loss of summer habitat had been removed or degraded (*e.g.,* fragmentation). We noted that forest conversion ''can result in a myriad of effects to the species, including direct loss of habitat, fragmentation of remaining habitat, and direct injury or mortality'' (80 FR 17993; April 2, 2015). In the interim 4(d) rule we exempted most forest-management activities except for the conversion of mature hardwood or mixed forest into intensively managed monoculture-pine plantation stands, or non-forested landscape (80 FR 18025; April 2, 2015).

Many of the comments on the proposed and interim 4(d) rules noted that habitat is not limiting for the northern long-eared bat. As we documented in the final listing determination (80 FR 1802; April 2, 2015), the extent of conversion from forest to other land cover types has been fairly consistent with conversion to forest (cropland reversion/plantings). Further, the recent past and projected amounts of forest loss to conversion was, and is anticipated to be, only a small percentage of the total amount of forest habitat. For example by 2060, 4 to 8 percent of the forested area found in 2007 across the conterminous United States is expected to be lost (U.S Forest Service 2012, p. 12). The northern long-eared bat has been documented to use a wide variety of forest types across its wide range. Therefore, we agree that the availability of forested habitat does not now, nor will it likely in the future, limit the conservation of the northern long-eared bat.

We have determined that when the prohibitions for the northern long-eared bat included in this final 4(d) rule are applied to forest-conversion activities, the potential for negative additive impacts to individuals or colonies is significantly reduced. As WNS impacts bat populations, unoccupied, suitable forage and roosting habitat will be increasingly available for remaining bats.

Tree-Removal Conservation Measures

Under this final 4(d) rule, incidental take within the WNS zone involving tree removal is not prohibited if two conservation measures are followed. The first measure is the application of a 0.25 mile (0.4 km) buffer around known occupied northern long-eared bat hibernacula. The second conservation measure is that the activity does not cut or destroy known occupied maternity roost trees, or any other trees within a 150-foot (45-m) radius around the maternity roost tree, during the pup season (June 1 through July 31). The rationale for these measures is discussed below.

Conservation Measure 1: Tree Removal Near Known Northern Long-eared Bat Hibernacula

''Known hibernacula'' are defined as locations where one or more northern long-eared bats have been detected during hibernation or at the entrance during fall swarming or spring emergence. Given the documented challenges of surveying for northern long-eared bats in the winter (use of cracks, crevices that are inaccessible to surveyors), any hibernacula with northern long-eared bats observed at least once, will continue to be considered ''known hibernacula'' as long as the hibernacula remains suitable for the northern long-eared bat. A hibernaculum remains suitable for northern long-eared bats even when *Pd* or WNS has been detected.

We have adopted the 0.25-mile (0.4-km) buffer around known northern long-eared bat hibernacula for several reasons: (1) It will help to protect micro-climate characteristics of the hibernacula; (2) for many known hibernacula, bats use multiple entrances that may not be reflected in the primary location information (*e.g.,* bats may use other smaller entrances that are often spread out from the main entrance accessed for surveys or other purposes) and the hibernacula may have extensive underground features that extend out from known entrances; (3) in the late summer and fall when bat behavior begins to center on hibernacula (swarming), it appears that northern long-eared bats may roost in a widely dispersed area, which may reduce the potential that any activity outside of this buffer would significantly affect the species; (4) outside of the maternity period, northern long-eared bats have demonstrated the ability to adapt to forest-management-related and other types of disturbances; and (5) regardless of the buffer size, bats will remain fully protected from take while in the hibernacula, when they are most vulnerable.

The microclimate, temperature, humidity, and air and water flow within a hibernaculum are all important variables that could potentially be impacted by forest management or other activities when conducted in proximity to a hibernaculum. A 0.25-mile (0.4-km) buffer will protect the hibernaculum's microclimate. Studies that have evaluated the depth of edge influence from forest edge or tree removal on temperature, humidity, wind speed, and light penetration suggest that although highly variable among forest types and other site-specific factors (such as aspect and season), the depth of edge influence can range from 164 feet (50 m) (Matlack 1993, p. 193) to over 1,312 feet (400 m) (Chen et al. 1995, p. 83). However, the hibernacula often selected by northern long-eared bats are ''large, with large passages'' (Raesly and Gates 1987, p. 20), and may be less affected by relatively minor surficial micro-climatic changes that might result from the limited exempted activities outside of the 0.25-mile (0.4-km) buffer. Further, bats rarely hibernate near the entrances of structures (Grieneisen 2011, p. 10), as these areas can be subject to greater

predation (Grieneisen 2011, p. 10; Kokurewicz 2004, p. 131) and daily temperature fluctuations (Grieneisen 2011, p. 10). Davis et al. (1999, p. 311) reported that partial clearcutting ''appears not to affect winter temperatures deep in caves.'' Caviness (2003, p. 130) reported that prescribed burns were found to have no notable influence on bats hibernating in various caves in the Ozark National Forest. All bats present in caves at the beginning of the burn were still present and in ''full hibernation'' when the burn was completed, and bat numbers increased in the caves several days after the burn. There were minute changes in relative humidity and temperature during the burn, and elevated short-term levels of some contaminants from smoke were noted.

Northern long-eared bat hibernacula can be large and complex and, spatially, may not be fully represented in locational information contained in species records by State or Federal agencies or by natural heritage programs. A 0.25-mile (0.4-km) buffer will help protect the spatial extent of many known hibernacula. For example, one limestone mine in Ohio used by northern long-eared bats had approximately 44 miles (71 km) of passages and multiple entrances (Brack 2007, p. 740). In northern Michigan, bats (including northern long-eared bats) occupied mines that were more structurally complex and longer (1,007 ft ± 2,837 ft (307m ± 865 m) than mines that were unoccupied, and the occupied mines had a total length of passages that ranged from 33 feet to 4 miles (10 meters to 6.4 kilometers) (Kurta and Smith 2014, p. 592).

Only a relatively small proportion of the areas where swarming northern long-eared bats may occur are likely to be affected by tree-removal activity. There are over 1,500 known hibernacula for the species in the United States (Service 2015, unpublished data), several known in Canada, and potentially many others yet to be identified. Lowe (2012, p. 58) reported that the roosts of northern long-eared bats were evenly distributed over distances within 4.6 miles (7.3 km) from a swarming site. If the northern long-eared bat's potential swarming habitat (including foraging habitat during that period) can be approximated as the forest habitat within 5 miles (8.1 km) of hibernacula, that equates to a 50,265 acre (20,342 ha) area per hibernaculum. In any given year, only a small proportion of the forest habitat within the potential swarming habitat is likely to be impacted by tree-removal activities (*e.g.,* generally 2 percent of forests are managed in any given year and over 1,500 hibernacula documented as used by the species). Similarly, forest conversion is anticipated to be relatively small compared to available habitat; therefore, based on our current understanding of potential swarming-habitat, on the scale of 50,000 acres (20,342ha) per hibernaculum, the relatively small foot-print of activities not prohibited by this final rule are unlikely to affect the conservation or recovery potential of the species. Raesly and Gates (1987, p. 24) evaluated external habitat characteristics of hibernacula and reported that for the northern long-eared bat the percentage of cultivated fields within 0.6 miles (1 km) of the hibernacula was greater (52.6 percent) for those caves used by the species, than for those caves not used by the species (37.7 percent), suggesting that the removal of some forest around a hibernacula can be consistent with the species needs.

Outside of the maternity period, northern long-eared bats have demonstrated the ability to respond successfully to forest-management-related and other types of disturbances. Therefore, the limited disturbance associated with incidental-take exceptions outside of the 0.25-mile (0.4-km) buffer on hibernacula is consistent with the conservation of the species. For example, Silvis et al.'s (2015, p.1) experimental removal of roosts suggested that the ''loss of a primary roost or 20 percent of secondary roosts in the dormant season may not cause northern long-eared bats to abandon roosting areas or substantially alter some roosting behaviors in the following active season when tree-roosts are used.''

Prior to WNS, the most significant risk identified for northern long-eared bat conservation was direct human disturbance while bats are hibernating (*e.g.,* Olson et al. 2011, p. 228; Bilecki 2003, p. 55; Service 2012, unpublished data). This final 4(d) rule (within the WNS zone) addresses these impacts.

We have prohibited incidental take of northern long-eared bats under specific tree-removal circumstances; however, that does not mean that all activities involving tree-removal activities within the 0.25-mile (0.4-k) buffer of hibernacula will result in take. For example, a timber harvest might be conducted within 0.25 miles (0.4 km) of a hibernaculum at a time when bats are unlikely to be roosting in trees within the buffer (*e.g.,* winter), which fully protects any bats in the hibernaculum as well as the hibernaculum's suitability for bats (*i.e.,* access, microclimate), and does not significantly change the suitability of the habitat for foraging by northern long-eared bats or perhaps even improves prey availability. In such a case, the timber harvest, although closer than 0.25 miles (0.4 km) to the hibernaculum, is not likely to result in incidental take so we would not recommend that the harvester seek authorization for incidental take pursuant to the Act. For activities planned within 0.25 miles (0.4 km) of hibernaculum, we encourage you to contact the local Ecological Services Field Office (*http://www.fws.gov/offices*) to help evaluate the potential for take of northern long-eared bats.

Conservation Measure 2: Tree Removal Near Known Maternity Roost Trees

Female northern long-eared bats roost communally in trees in the summer (Foster and Kurta 1999, p. 667) and exhibit fission-fusion behavior (Garroway and Broders 2007, p. 961), where members frequently roost together (fusion), but the composition and size of the groups is not static, with individuals frequently departing to be solitary or to form smaller or different groups (fission) (Barclay and Kurta 2007, p. 44). As part of this behavior, northern long-eared bats switch tree roosts often (Sasse and Pekins 1996, p. 95), typically every 2 to 3 days (Foster and Kurta 1999, p. 665; Owen et al. 2002, p. 2; Carter and Feldhamer 2005, p. 261; Timpone et al. 2010, p. 119). In Missouri, the longest time spent roosting in one tree was 3 nights (Timpone et al. 2010, p. 118). Bats switch roosts for a variety of reasons, including temperature, precipitation, predation, parasitism, sociality, and ephemeral roost sites (Carter and Feldhamer 2005, p. 264).

Maternity colonies, consisting of females and young, are generally small, numbering from about 30 (Whitaker and Mumford 2009, p. 212) to 60 individuals (Caceres and Barclay 2000, p. 3); however, one group of 100 adult females was observed in Vermilion County, Indiana (Whitaker and Mumford 2009, p. 212) and Lereculeur (2013, p. 25) documented a colony of at least 116 northern long-eared bats. In West Virginia, maternity colonies in two studies had a range of 7 to 88 individuals (Owen et al. 2002, p. 2) and 11 to 65 individuals, with a mean size of 31 (Menzel et al. 2002, p. 110). Lacki and Schwierjohann (2001, p. 485) found that the number of bats within a given roost declined as the summer progressed. Pregnant females formed the largest aggregations (mean=26) and post-lactating females formed the smallest aggregation (mean=4). Their largest overall reported colony size was 65 bats.

Northern long-eared bats change roost trees frequently, but use roost areas repeatedly and to a lesser extent, reuse specific roosts (*e.g.,* Cryan et al. 2001, p. 50; Foster and Kurta 1999, p. 665). The northern long-eared bat appears to be somewhat flexible in tree-roost selection, selecting varying roost tree species and types of roosts throughout its range. Females tend to roost in more open areas than males, likely due to the increased solar radiation, which aids pup development (Perry and Thill 2007, p. 224). Fewer trees surrounding maternity roosts may also benefit juvenile bats that are starting to learn to fly (Perry and Thill 2007, p. 224). Female roost-site selection, in terms of canopy cover and tree height, changes depending on reproductive stage; relative to pre- and post-lactation periods, lactating northern long-eared bats have been shown to roost higher in tall trees situated in areas of relatively less canopy cover and lower tree density (Garroway and Broders 2008, p. 91).

The northern long-eared bat's tendency for frequent roost switching may help them avoid or respond effectively to disturbance by people outside of the maternity season. The frequent-roost-switching behavior of northern long-eared bat suggests that they are adapted to responding quickly to changes in roost availably (ephemeral roosts), changing environmental conditions (temperature), prey availability, or physiological needs (torpor, reproduction). In a study of radio-tracked northern long-eared bats responding to the disturbance from prescribed fire (Dickinson et al. 2009, pp. 55–57), the bats appeared ''to limit their exposure to conditions created by fire. At no point did they fly outside of their typical home range area, nor did they travel far from the burn itself.'' While some of the bats soon returned to areas recently burned, by day 6 and 7 post burn, they ''appeared to return to pre-burn norms in terms of emergence time, length of foraging bouts, and use of the burn unit and adjacent habitats.'' Carter et al. (2000, pp 139–140), noted that ''During the summer months, bats are able to arouse quickly as the difference between the ambient temperature and active body temperature of bats is less. Most bat species utilizing trees and snags have multiple roosts throughout the forest (Sasse and Pekins 1996; Callahan et al. 1997; Menzel et al. 1998; Foster and Kurta 1999, Menzel et al. 2001), providing alternate roosts should the current roost be destroyed by fire.'' Sparks et al. (2008, pp. 207–208) documented that northern long-eared bats released in the open during the day demonstrated a successful rapid ''flight-to-cover'' response.

Adult females give birth to a single pup (Barbour and Davis 1969, p. 104). Birthing within the colony tends to be synchronous, with the majority of births occurring around the same time (Krochmal and Sparks 2007, p. 654). Parturition (birth) likely occurs in late May or early June (Caire et al. 1979, p. 406; Easterla 1968, p. 770; Whitaker and Mumford 2009, p. 213), but may occur as late as July (Whitaker and Mumford 2009, p. 213). Upon birth, the pups are unable to fly, and females return to nurse the pups between foraging bouts at night. In other *Myotis* species, mother bats have been documented carrying flightless young to a new roosting location (Humphrey et al. 1977, p. 341). The ability of a mother to move young may be limited by the size of the growing pup. Juvenile volancy (flight) often occurs by 21 days after birth (Krochmal and Sparks 2007, p. 651; Kunz 1971, p. 480) and has been documented as early as 18 days after birth (Krochmal and Sparks 2007, p. 651). Prior to gaining the ability to fly, juvenile bats are particularly vulnerable to tree-removal activities. Based on this information, we have determined that the most sensitive period to protect pups at maternity roost trees is from June 1 through July 31 (the ''pup season'').

Known occupied maternity roost trees are defined as trees that have had female northern long-eared bats or juvenile bats tracked to them or the presence of female or juvenile bats is known as a result of other methods. Once documented, northern-long eared bats are known to continue to use the same roosting areas. Therefore, a tree will be considered to be a ''known, occupied maternity roost'' as long as the tree and surrounding habitat remain suitable for northern long-eared bats. The incidental take prohibition for known, occupied maternity roosts trees applies only during the during the pup season (June 1 through July 31).

In addition to protecting the known roosts, we have also included in this conservation measure avoiding the cutting or destroying of any other trees within a 150-foot (45-meter) radius from the known, occupied maternity roost tree during the pup season (June 1 through July 31). Leaving a buffer of other trees around the maternity roost tree will help to protect the roost tree from damage or destruction that may be caused by other nearby trees being removed as well as helping protect the roost tree from wind throw and micro-climate changes. O'Keefe (2009 p. 42) documented that a 39-foot (12-meter) buffer around a maternity roost tree during a harvest in May allowed the roost to be successfully used through late July and that one buffered tree was used 2 years in a row. We have adopted a standard for exception of take that is almost four times that which proved effective in this example, in order to better account for the variation in forest types used by the northern long-eared bat and a variety of slopes that might influence how large a buffer may need to be in order to prove effective. Roost trees used by northern long-eared bats are often in fairly close proximity to each other within the species' summer home range. For female northern long-eared bats, the mean distance between roosts was reported as 63m to 600m from a variety of studies published 1996 through 2014 (Foster and Kurta 1999 p. 665; Cryan et al. 2001, p. 46; Swier 2003, pp. 58–59; Jackson 2004, p. 89; Henderson and Broders 2008, p. 958; Johnson et al. 2009, p. 240; Badin 2014, p. 76; Bohrman and Fecske, unpublished data). Further, within that data, the distance between roosts was reported as small as 5 meters in one study (Badin 2014, p. 76) and 36 meters in another (Jackson 2004, p. 89). As Sasse 1995, p. 23, noted ''some roost sites appeared to be 'clustered' together.'' Therefore, even this modest additional buffer may also protect other roosts trees used by female northern long-eared bats during the maternity period that have not yet been documented. In addition, because colonies occupy more than one maternity roost in a forest stand and individual bats frequently change roosts, in some cases a portion of a colony or social network is likely to be protected by multiple 150-foot buffers during the maternity season.

Currently, since most States and natural heritage programs do not track roosts and many have not tracked any northern long-eared bat occurrences, we recognize that not all northern long-eared bat maternity roost sites are known. Therefore, this measure will not protect an unknown maternity roosts unless it falls under one of the buffers related to protecting a known roost or hibernaculum.

Although not fully protective of every individual, the conservation measures identified in this final rule help protect maternity colonies. This final species-specific rule under section 4(d) of the Act provides the regulatory flexibility for certain activities to occur that have not been the cause of the species' imperilment, while allowing us to focus conservation efforts on WNS, promoting

conservation of the species across its range.

Additional Prohibitions and Exceptions

In this final 4(d) rule we carry forward other standard prohibitions and exceptions that are typically applied to threatened species and are currently applicable under the interim rule for the northern long-eared bat. These prohibitions included the possession of and other acts with unlawfully taken northern long-eared bats, as well as import and export. We also included standard exemptions, including all the permitting provisions of 50 CFR 17.32 and the exemption for employees or agents of the Service, of the National Marine Fisheries Service, or of a State conservation agency when acting in the course of their official duties to take northern long-eared bats covered by an approved cooperative agreement to carry out conservation programs.

Summary of Comments and Recommendations on the Proposed and Interim 4(d) Rules

The northern long-eared bat was listed as a threatened species under the Act, with an interim rule under section 4(d) of the Act, on April 2, 2015 (80 FR 17974). At that time, the Service invited public comments on the interim 4(d) rule for 90 days, ending July 1, 2015. The Service had already received comments for 60 days on its proposed 4(d) rule (80 FR 2371, January 16, 2015). In total, the Service received approximately 40,500 comments on the proposed and interim 4(d) rules. We discuss them below.

Peer Reviewer Comments

1. *Comment:* Peer reviewer(s) commented that the 0.25-mile (radius) around hibernacula is an inadequate buffer. There were additional suggestions for alternative buffer distances as well as more detail on how activities might be limited within those buffers. A specific suggestion of a 1.6-mile buffer was made, with a statement that most forest practices could occur within the buffer provided that the trees were not completely removed (conversion). In addition, a suggestion of 0.5-mile buffer was made.

Our Response: We have revised the approach used in this final 4(d) rule to ensure that hibernating northern long-eared bats in the WNS zone are protected from incidental take independent of the buffer size used in the conservation measure. In addition, all northern long-eared bats both in and outside of the WNS zone are protected from purposeful take (*e.g.,* killing or intentionally harassing northern long-eared bats), including while in the hibernacula where they are most vulnerable. We have retained the 0.25-mile buffer (0.25-mile radius around known hibernacula entrance/access points used by bats) to further protect the hibernaculum and associated forested habitat for several reasons (see discussion above under *Conservation Measure 1: Tree Removal Near Known Northern Long-eared Bat Hibernacula*). Some of the peer-reviewers recommended that within the hibernacula buffer that certain limited activities should be allowed (*e.g.,* timber harvest that only removes a small percentate of the forest habitat when bats are not active). As discussed above under *Conservation Measure 1: Tree Removal Near Known Northern Long-eared Bat Hibernacula,* not all tree-removal activities within the buffer of hibernacula will result in take. For example, a timber harvest might be conducted within the buffer when bats are unlikely to be roosting in trees (*e.g.,* winter) that fully protects any bats in the hibernaculum as well as the hibernaculum's suitability for bats (*i.e.,* access, microclimate), and does not significantly change the suitability of the habitat for foraging by northern long-eared bats or perhaps even improves prey availability. In such a case, the timber harvest, although within the buffer, is not likely to result in incidental take so we would not recommend that the harvester seek authorization for incidental take pursuant to the Act. Because the buffer only applies to actions that result in incidental take of the northern long-eared bat, we determined that there was no need to attempt to exempt activities (*e.g.,* a limited timber harvest) where incidental take is unlikely.

2. *Comment:* Peer reviewer(s) commented that the WNS buffer zone should be removed and protections should occur throughout the range of the species.

Our Response: We have established prohibitions on the purposeful take of northern long eared bats throughout the species range. However, because WNS is the most significant threat known to be imperiling the species, we have determined that in areas where WNS has not been detected, additional prohibitions are not warranted. We recognize that the WNS zone will change over time. We remain committed to regularly updating the WNS zone map as new information about the spread of the *Pd* fungus becomes known.

3. *Comment:* Peer reviewer(s) commented that the WNS buffer zone should be expanded and/or changed to accommodate a more site-specific approach, based on proximity to hibernacula, for example.

Our Response: We reevaluated the approach to the WNS zone in this final rule and determined that the 150-mile buffer used for the interim 4(d) rule appears to be very effective in capturing counties where new *Pd* detections are reported, in particular when looking at the new occurrences over the last 5 years. For more details of this analysis, please see our discussion in the WNS Zone section of this rule.

4. *Comment:* Peer reviewer(s) commented that the Service's definitions relative to forestry practices should be more precise and should use silviculture terminology.

Our Response: We have revised the prohibitions to no longer use specific forestry practices or silviculture terminology. Take of the northern long-eared bat within the context of forest management is not prohibited provided that conservation measures to protect hibernacula and known maternity roost trees are implemented as described in this rule.

5. *Comment:* Peer reviewer(s) recommended that the seasonal restrictions for the northern long-eared bat ''pup season'' be expanded and/or based on climate and geography within the species' range.

Our Response: We recognize that in some areas or in some years the period when young northern long-eared bats are non-volant may be earlier or later than the June and July timeframe. The timing of when northern long-eared bats give birth is likely a complex interplay of a variety of factors affecting fetal development (*e.g.,* condition of the mother, temperature, prey availability), and similar factors may also influence the time required for young to develop the ability to fly. In addition, a study in West Virginia documented that the peak pregnancy and lactation dates shifted post WNS (Francl et al. 2012, p. 36). However, looking across a variety of studies, the June and July timeframe appears to generally capture what is typically reported as the non-volant period for northern long-eared bats across much of their range within the United States. We have determined that a single timeframe for implementing the prohibition on maternity roost tree removal provides clarity for the regulated public. In addition, while it does not modify the incidental take prohibition established in these regulations, our local field offices may be able to provide more refined local estimates of the non-volant period for specific areas. Project planners may choose to use these local estimates for

planning purposes where they are available.

6. *Comment:* Peer reviewer(s) recommended year-round protections for maternity roost trees or conversely that we remove entirely the protections for maternity trees because it is ineffective and serves as a disincentive for conducting surveys.

Our Response: Although northern long-eared bats have been documented to use some roost trees over multiple years, in many cases it is because the tree is dead or dying or has structural defects that provides the roosting features attractive to the species. Further, maternity roost trees are used only briefly (*e.g.,* northern long-eared bats typically change roosts every few days, and only a relatively small percentage of those are used more than once in any one season). Given that maternity roosts trees are ephemeral on the landscape and used for very short periods of time in the active season, we determined that year-round protections for known, occupied maternity roost trees are not warranted. We considered removing the protections for known, occupied maternity roosts as recommended by another peer reviewer, but instead modify the protection so as to minimize the disincentive for conducting surveys. In developing this final rule, we kept protections for known, occupied maternity roosts for two reasons: (1) While it may be unlikely, in cases where a tree was about to be removed, but was known to be occupied by northern long-eared bats, they would have some protections while the young could not fly; and (2) we wanted known, occupied maternity roosts to be given consideration because they help to signal to project planners an area that is likely to be used by northern long-eared bats in the future (as this species has a high degree of site fidelity). We refined the protection for known, occupied maternity roosts to make it as practical to implement as possible in order to minimize the disincentive created for conducting surveys. Many forest managers implement similar types of relatively small seasonal buffers to protect other species of sensitive wildlife (*e.g.,* around nesting raptors) and therefore we do not view this provision as a real disincentive to conducting surveys. Please see the *Conservation Measure 2: Tree Removal Near Known Maternity Roost Trees* section of this rule for additional details. We believe that the seasonal restriction helps to protect the most vulnerable life stages, in this case the non-volant pups, and is adequate for the purposes of this rule.

7. *Comment:* Peer reviewer(s) recommended that pregnant females should be protected as part of the seasonal restriction criteria.

Our Response: We recognize that pregnant females may be in torpor or less able to flee in early spring. However, we did not have information on how pregnancy in northern long-eared bats influenced the degree of torpor or their ability to flee from disturbance. As discussed in this rule, we expect only a small percentage of the species' forested habitat to be affected by activities (*e.g.,* tree removal, prescribed fire) that might impact a pregnant northern long-eared bats in torpor and, therefore, we expect only small proportion of the species' population to be potentially exposed to these activities. Because of the relatively small exposure and uncertainty about how pregnancy affects degree of torpor or ability to flee, we have not expanded the seasonal protections for this purpose. We believe that seasonal restrictions help protect the vulnerable pup stage, when young pups cannot fly, and are adequate for the purposes of this rule.

8. *Comment:* Peer reviewer(s) stated that the conservation efforts will not be effective because the natural heritage data are limited with respect to known maternity roost trees and hibernacula.

Our Response: We agree that the data are limited and this can be challenging from the implementation and/or project planning perspective. However, we have purposefully limited protections where possible, to minimize the potential disincentive to continue to survey for the species. However, we anticipate that information in State natural heritage data bases will continue to improve post-listing.

9. *Comment:* Peer reviewer expressed concern with allowing lethal take of northern long-eared bats from human dwellings.

Our Response: We encourage the non-lethal removal of northern long-eared bats from human structures, preferably by excluding them outside of the maternity period, whenever possible. However, because of the potential for human health considerations, we have not required this as part of the exception to the purposeful take prohibition. We have limited this take to houses, garages, barns, sheds, and other buildings designed for human entry.

Public Comments

General

10. *Comment:* Commenters from many development sectors requested that their activities be included in the suite of exempted activities under the 4(d) rule (specific sectors addressed below).

Our Response: In general, this final rule has been restructured to clarify prohibitions to take rather than to rely on a list of excepted activities. Prohibitions are applied in this final rule where necessary and advisable for the conservation of the species. Therefore, the various ''sectors'' do not need to be identified or ''excepted'' to apply rule provisions.

Forest Management

11. *Comment:* Several commenters recommended that forest conversion be included as an excepted activity. Comments were specific to conversion of hardwood forests to pine plantations, managed pine forest, pine ecosystem, and the Service's characterization of pine stands as monoculture stands representing poor bat habitat.

Our Response: Incidental take resulting from forest management, including forest conversion, is not a prohibited action pursuant to this final 4(d) rule provided conservation measures to protect known hibernacula and known, occupied maternity roost trees are employed. Please see sections above titled Forest Management and Forest Conversion.

12. *Comment:* Commenters stated that forest management must occur to avoid habitat deterioration to poor quality bat habitat. They further stated that forest health depends upon active management including tree removal and clearcutting.

Our Response: We agree that forest management can be very important in creating or maintaining forest successional patterns that help to ensure suitable trees are available for roosting northern long-eared bats. Further, forest management can help to increase prey availability or suitability of foraging habitat. Please see our discussion above under Forest Management for additional details. Incidental take resulting from forest management is not prohibited pursuant to this final 4(d) rule provided conservation measures to protect known hibernacula and known maternity roost trees are employed.

13. *Comment:* Commenters suggested that the Service consider exemptions for sustainable forest practices implemented under a sustainable forest management plan or sustainable forestry certificate program.

Our Response: We considered incorporating other possible conservation measures related to forest management and conversion. However, given the overall small percentage of the species' range potentially affected by

these activities in any given year, it was not clear that additional conditions related to incidental take from forest management or conversion would meaningfully change the conservation outlook for the species. Further, adding protections with uncertain benefits, but with large potential public impacts can hinder support for species conservation. Incidental take resulting from forest management is not prohibited pursuant to this final 4(d) rule provided conservation measures to protect known hibernacula and known, occupied maternity roost trees are employed.

14. *Comment:* Commenters stated that the Service should focus on the elimination of WNS rather than regulating timber harvest in summer habitat.

Our Response: Efforts to address the threat posed by WNS are on-going by the Service and many partners across the species range. Incidental take resulting from forest management or forest conversion is not prohibited pursuant to this final 4(d) rule provided conservation measures to protect known hibernacula and known, occupied maternity roost trees are employed.

15. *Comment:* A commenter stated that the Service should halt commercial timber harvest and another commenter suggested restricting the removal of snags and coarse woody debris in areas populated by the species.

Our Response: The northern long-eared bat is not limited in terms of habitat availability for feeding, breeding, and sheltering in the summer (non-hibernating) months. Please see the discussions under Forest Management and Forest Conversion above in this rule. We have carefully considered the value of habitat protection for the species. We have determined that protection of summer habitat is not required for species conservation except where trees may be occupied by young, non-volant (flightless) pups and for areas immediately surrounding hibernacula where they swarm and feed just prior to hibernation and when they emerge from hibernation in the spring. Due to this swarming behavior and the vulnerability of bats when hibernating, we have determined that take prohibitions are necessary and advisable in winter habitat (hibernacula), where bats are subject to the effects of WNS. In addition, we have determined that protection of known, occupied maternity roost trees is necessary and advisable in order to protect young pups.

16. *Comment:* The Service should increase protections to avoid impacts to bats from the point that they emerge from hibernation to the end of the maternity/pup season. Forest management should only be done in a manner that retains sufficient vegetative cover and protects northern long-eared bats at the maternity colony level.

Our Response: We considered incorporating other possible conservation measures related to forest management and conversion. However, given the overall small percentage of the species' range potentially affected by these activities in any given year, it was not clear that additional conditions related to the incidental take from forest management or conversion would meaningfully change the conservation outlook for the species. Further, adding protections with uncertain benefits, but with large potential public impacts can hinder support for the species conservation. We have determined that protection of known, occupied maternity roost trees during the months of June and July is an adequate conservation measure for the protection of non-volant pups.

17. *Comment:* Commenter(s) suggested an exemption for invasive species management in forested landscapes.

Our Response: Outside of hibernacula, this final rule does not prohibit take from activities other than tree removal. Therefore, incidental take associated with management of invasive species using pesticides or other interventions is not prohibited. Where intervention involves tree removal, conservation measures must be followed to comply with this rule. However, entities that cannot apply the required conservation measures have other means to have take excepted, such as section 10 permits or section 7 incidental take authorization.

Human Structures

18. *Comment:* Commenters suggested expansion of the definition of human structures/dwellings to include bridges, culverts, cattle passes, and other human-made structures.

Our Response: This final rule does not prohibit direct take of northern long-eared bats occupying human structures defined as houses, garages, barns, sheds, and other buildings designed for human entry. While we encourage landowners and project proponents to find other mechanisms to avoid killing or injuring bats that occupy bridges, culverts, and other structures, incidental take is not prohibited by this rule. While bridge and culvert use for the species has been documented, it is relatively uncommon compared to tree or other types of roost sites (*e.g.,* barns) and, therefore, did not warrant specific provisions in this final rule. Within the WNS zone, however, project proponents must apply conservation measures to avoid habitat removal around hibernacula and to avoid cutting or destroying known, occupied maternity roost trees or any other trees within a 150-foot radius from the maternity roost tree during June and July.

19. *Comment:* Commenters stated that take of northern long-eared bat in human dwellings should not be exempted and requested that the Service provide rationale for determining that this exemption is necessary.

Our Response: We encourage the non-lethal removal of northern long-eared bats from human structures whenever possible, preferably by excluding them from the structure outside of the maternity period. However, because of the potential for human health considerations, we have not required this as part of the exception to the purposeful take prohibition. Please see the discussion under Exceptions to the Purposeful Take Prohibition in this rule for additional details. Take of northern long-eared bats to remove them from human structures is not prohibited.

Hazardous Tree Removal

20. *Comment:* Several comments requested clarification and/or expansion of the exception to take for removal of hazardous trees.

Our Response: Our intent is to provide for the removal of hazardous trees for the protection of human life and property. This is not the same as hazard tree removal within the context of forest management or rights-of-way management where hazard trees are identified as trees that are in danger of falling. Incidental take of northern long-eared bats from hazardous tree removal in the context of rights-of-way management is not prohibited by the final 4(d) rule provided conservation measures to protect known hibernacula and known, occupied maternity roost trees are applied.

Minimal Tree Removal

21. *Comment:* Several commenters requested that minimal tree removal be expanded to a larger acreage.

Our Response: Conversion of forested cover to alternate uses is not prohibited under this final rule, provided that conservation measures are followed when those activities occur within the WNS zone. For a discussion of this issue, please see Forest Conversion section in this rule.

22. *Comment:* Several commenters stated that the exemption for minimal tree removal should be expanded to other (non-forest) industry entities and should include all activities that have a

minimal effect on the northern long-eared bat.

Our Response: Conversion of forested acreages to alternate uses is not prohibited under this final rule, provided that conservation measures are followed. This is applicable to all entities that may engage in activities that remove trees or convert forested acres. See the Forest Conversion section in this rule.

Oil and Gas Industry

23. *Comment:* A number of commenters from the oil and gas industry stated that the industry should be included within exemptions from take prohibitions because: (1) Their impact on northern long-eared bat habitat is small compared to forest management impacts; (2) habitat is re-vegetated following pipeline installation; (3) oil and gas exploration and transport are not the stated primary threat to the species (WNS is the primary threat); and (4) adequate regulatory mechanisms exist for mitigating industry environmental impacts.

Our Response: Take of northern long-eared bats attributable to habitat conversion and habitat loss is not prohibited under this final 4(d) rule, provided that developers and project proponents follow conservation measures described herein when activities occur within the WNS zone. See the Forest Conversion section in this rule.

Rights-of-Way

24. *Comment:* Commenter(s) stated that loss of habitat attributable to clearing for linear projects is miniscule compared to habitat conversion due to forest management.

Our Response: Incidental take attributable to maintenance, development, and rights-of-way expansion is not prohibited by this final 4(d) rule, provided conservation measures contained herein are followed when activities occur within the WNS zone.

25. *Comment:* Commenter(s) stated that the exception, as proposed and implemented via the interim rule, should be expanded to greater than 100-feet and should be clarified.

Our Response: Incidental take attributable to maintenance, development, and rights-of-way expansion is not prohibited by this final 4(d) rule, provided conservation measures contained herein are followed when activities occur within the WNS zone.

26. *Comment:* Commenter(s) stated that the exception for rights-of-way should be expanded to include new rights-of-way and transmission corridors.

Our Response: Incidental take attributable to maintenance, development, and rights-of-way expansion is not prohibited by this final 4(d) rule, provided conservation measures contained herein are followed when activities occur within the WNS zone.

27. *Comment:* Commenter(s) disagree with the Service's assertion that vegetation removal within or adjacent to rights-of-way is a small-scale alteration of habitat.

Our Response: It is within the context of the species range and potential for available habitat that right-of-way development, maintenance or expansion are small scale alterations of forest habitat. The extent of conversion from forest to other land cover types has been fairly consistent with conversion to forest (cropland reversion/plantings). Further, the recent past and projected amounts of forest loss to conversion from all sources was and is anticipated to be only a small percentage of the total amount of forest habitat. For example by 2060, 4 to 8 percent of forest area found in 2007 across the conterminous United States is expected to be lost (U.S Forest Service 2012, p. 12). We have not broadened the incidental prohibition related to habitat loss because WNS is the predominant threat to the species. Summer habitat does not now or in the future appear likely to be a limiting factor for the species; therefore, we have focused the protections on vulnerable individuals in summer habitat and protecting the winter habitat, where sensitivity to the effects of WNS is heightened.

28. *Comment:* Commenter(s) requested that the Service expand the rights-of-way exemption to include access roads and infrastructure required to deliver services.

Our Response: Incidental take attributable to maintenance, development, and rights-of-way expansion is not prohibited by this final 4(d) rule, provided conservation measures contained herein are followed when activities occur within the WNS zone. This includes related activities such as access road clearing and facilities related to delivery of services. In the case where tree removal is the activity in question, incidental take is not prohibited provided that the conservation measures herein are followed when those activities occur within the WNS zone.

29. *Comment:* Commenter suggested that the final 4(d) rule should prohibit all tree clearing activities related to the maintenance, repair, and creation of rights-of-way.

Our Response: The northern long-eared bat is not limited in terms of habitat availability for feeding, breeding, and sheltering in the summer (non-hibernating) months. We have carefully considered the value of habitat protection for the species. We have determined that protection of summer habitat is not required for species conservation except where trees are known to be occupied by northern long-eared bats when the young are non-volant (flightless) and for areas immediately surrounding hibernacula where they swarm and feed just prior to hibernation and when they emerge from hibernation in the spring.

Solar Energy

30. *Comment:* Commenter(s) requested that solar energy development be provided an exemption under the 4(d) rule.

Our Response: Solar energy developers will need to consider the impacts of their development and operations in light of the prohibitions of this rule. Incidental take outside of the WNS zone is not prohibited. Incidental take from tree-removal activities within the WNS zone is prohibited under specific conditions related to known hibernacula and known, occupied maternity roost trees (see Activities Involving Tree Removal section above for details).

Agriculture

31. *Comment:* Commenter(s) requested that agricultural activities be included in the suite of exempted activities under the 4(d) rule.

Our Response: We have substantially revised the prohibitions and exceptions in this final rule that may apply to agricultural activities. Agricultural producers/operators will need to consider the impacts of their activities in light of the prohibitions of this rule. Incidental take outside of the WNS zone is not prohibited. Incidental take from tree removal activities within the WNS zone is prohibited under specific conditions related to known hibernacula and known, occupied maternity roost trees (see Activities Involving Tree Removal, above, for details). This final rule has been restructured in a manner that it applies prohibitions where necessary and advisable for conservation of the species. Therefore, agricultural development and operations do not need to be specifically ''excepted'' in order to apply the rule's provisions.

Caves and Mines

32. *Comment:* Commenter(s) requested an exemption for show caves and cave tours.

Our Response: Hibernating bats are very sensitive to disturbance as discussed in greater detail under the Hibernacula section of this document. This final rule prohibits the incidental take of northern long-eared bats in hibernacula inside the WNS zone as well as the purposeful take (*e.g.,* purposefully harassing or killing) of northern long-eared bats in hibernacula both inside and outside of the WNS zone. When this species occupies caves or mines used by people regardless of the purpose, the provisions of this 4(d) rule apply. Show cave or mine activities inside the WNS zone that do not result in the incidental take of northern long-eared bats are not prohibited. In other words, if northern long-eared bats are not being disrupted from their normal hibernation behaviors (*e.g.,* by avoiding areas with hibernating bats, limiting noise and lighting in areas used by bats), we do not consider human use of the cave or mine to be a ''take'' of the bats.

33. *Comment:* Commenter(s) stated that an exemption should be made available for mining, mineral exploration, and coal extraction activities.

Our Response: Incidental take of northern long-eared bats that results from tree-removal activity, including mining operations, is prohibited in some circumstances (see Activities Involving Tree Removal, above). However, hibernating bats are very sensitive to disturbance, as discussed in greater detail under the Hibernacula section of this rule. This final rule prohibits the incidental take of northern long-eared bats in hibernacula inside the WNS zone as well as the purposeful take (*e.g.,* purposefully harassing or killing) of northern long-eared bats in hibernacula both inside and outside of the WNS zone. Inside the WNS zone, the take of northern long-eared bats in mines and man-made tunnels for mineral or coal extraction includes any activity that kills, injures, harms, or harasses the species. Mining, mineral exploration, and coal extraction activities will need to work with the Service to find alternative means to authorize take, such as through a section 10 permitting process or section 7 process where applicable. Mining activities inside the WNS zone that do not result in the incidental take of northern long-eared bats are not prohibited. In other words, if northern long-eared bats are not being killed, injured, or otherwise disrupted from their normal hibernation behaviors by the mining operations, we do not consider those activities to be a ''take'' of the bats.

34. *Comment:* Commenter(s) suggested that activities designed to reclaim abandoned mines or maintain cave environments for the benefit of wildlife species should be exempt under the 4(d) rule.

Our Response: We agree that beneficial reclamation and maintenance should be encouraged. However, exception from take prohibitions through a species-specific 4(d) rule is not the appropriate mechanism for authorizing this activity. Where abandoned mines and cave environments are in use by northern long-eared bats, take associated with maintenance is prohibited; however, we encourage project proponents to work with the Service to implement best management practices to avoid or minimize the effects of their actions in the interest of habitat improvement. We will work with project proponents to determine alternate ways to authorize activities, such as section 10 permits or section 7 incidental take authorization.

Mosquito Control

35. *Comment:* Commenter challenges the Service's assertion that chemicals used in mosquito control (malathion and others of comparable risk to mammals) pose a risk to northern long-eared bats; commenter further requests an exemption for mosquito control activities, especially where there is a public health risk.

Our Response: Please see the Environmental Contaminants section of this rule for details concerning our evaluation of the risks from pesticide applications. After careful consideration of the available information, we do not include in this rule a prohibition on the incidental take of northern long-eared bats as result of pesticide application provided the application is a ''lawful activity,'' that is, it must comply all applicable State laws. Any northern long-eared bat unlawfully taken pursuant to a State pesticide law would be a violation of this final 4(d) rule.

Adequacy and Clarity of 0.25 Mile Hibernacula Buffer

36. *Comment:* Commenter(s) suggested that this buffer is too restrictive for landowners.

Our Response: The Service has determined that a protective buffer around known hibernacula is necessary and advisable for the conservation of the species. Please see the discussion under *Conservation Measure 1: Tree Removal Near Known Northern Long-eared Bat Hibernacula* of this rule for our explanation of the need for this buffer. As described in that section, we have prohibited incidental take of northern long-eared bats under specific tree-removal circumstances; however, that does not mean that all activities involving tree-removal activities within the 0.25-mile (0.4-km) buffer of hibernacula will result in take. For example, a timber harvest might be conducted within 0.25 miles (0.4 km) of a hibernaculum at a time when bats are unlikely to be roosting in trees within the buffer (*e.g.,* winter) that fully protects any bats in the hibernaculum as well as the hibernaculum's suitability for bats (*i.e.,* bat's access, microclimate), and does not significantly change the suitability of the habitat for foraging by northern long-eared bats or perhaps even improves prey availability. In such a case, the timber harvest, although closer than 0.25 miles (0.4 km) to the hibernaculum, is not likely to result in incidental take, so we would not recommend that the timber harvester seek authorization for incidental take pursuant to the Act. Further, while incidental take of northern long-eared bats within that buffer is prohibited (in the WNS zone), it may be authorized on a case-by-case basis with further coordination with the Service at a local level. Take may be authorized through section 10 or section 7 of the Act. In addition, it is our expectation that project modifications may be made that would protect the hibernaculum and allow for the project proponent's objectives to be met.

37. *Comment:* Commenter(s) seek clarification on whether the buffer and prohibition to clearcutting (within the buffer) is a year-round restriction.

Our Response: Yes, the protection of the hibernaculum and a buffer around it is a year round protective measure and applies to all types of tree-removal activities in the WNS zone.

38. *Comment:* Commenter(s) suggested that the buffer around hibernacula be limited to fall swarming and spring emergence when northern long-eared bats are present.

Our Response: We have determined that protective measures must be considered year-round for several reasons, including that habitat lost outside of the spring emergence and fall swarming period could affect the suitability of those habitats later during spring emergence or fall swarming. Further, we have included the buffer on hibernacula for several reasons beyond protecting foraging habitat during fall swarming and spring emergence. In particular, the buffer will help to protect the micro-climate characteristics of

hibernacula and other entrances used by bats that may not be reflected in the primary location information for hibernacula. For example, many caves or abandoned mines used may have entrances used by bats that are not reflected in the general location information for those sites that are used by people; a buffer helps to protect less prominent features that may be important to bats. Projects may be able to be planned or modified within those buffer areas to retain sufficient habitat and avoid harm; however, the Service considers coordination on a case-by-case basis to be important to assure necessary conservation.

39. *Comment:* Several commenter(s) suggested an increased buffer area around hibernacula would be more appropriate.

Our Response: We have revised the approach used in this final 4(d) rule to ensure that hibernating northern long-eared bats in the WNS zone are protected from incidental take independent of the buffer size used in the conservation measure. In addition, all northern long-eared bats both inside and outside of the WNS zone are protected from purposeful take (*e.g.,* killing or intentionally harassing northern long-eared bats), including while in hibernacula where they are most vulnerable. We have retained the 0.25-mile buffer (0.25-mile radius from known hibernacula entrance/access points used by bats) to further protect the hibernacula and associated forested habitat for several reasons (see discussion above under *Conservation Measure 1: Tree Removal Near Known Northern Long-eared Bat Hibernacula*).

40. *Comment:* Commenter(s) expressed concern with implementing measures when they do not have data/information on known hibernacula.

Our Response: The Service recognizes the challenges associated with data sharing and data management. Many states share data management concerns and guard data carefully. We encourage landowners to continue to work with your State natural resources and natural heritage staff to evaluate your ownership for the presence of these important resources. When seeking information on the presence of hibernacula within your project boundary, our expectation is that a project proponent will complete due diligence to determine available data. However, if information is not available, we recognize that the project proponent that has made reasonable efforts to determine whether there are known hibernacula on the property is in the position of not knowing if no data have been provided.

Maternity Roost Tree Restrictions

41. *Comment:* Commenter(s) expressed concerns about having adequate information to identify maternity roost trees.

Our Response: We recognize the challenges associated with data sharing. Please see response to Comment 40. While not required by this rule, the Service recommends summer surveys to definitively locate maternity roost trees.

42. *Comment:* Commenter(s) requested that we clarify that roost trees means maternity roost trees.

Our Response: We have made this final 4(d) rule specific to maternity roost trees.

43. *Comment:* Commenter(s) expressed disagreement with the 0.25 mile buffer around known, occupied roost trees. Some commented that this buffer was too small, while some commented that it was too large.

Our Response: In the interim 4(d) rule (80 FR 17974; April 2, 2015), the buffer around known, occupied roost trees applied only to some types of tree-removal activities (*e.g.,* forest management, rights-of-ways, prairie management) and excluded only clearcuts (and similar harvest methods). Given the relatively small percent of forest habitat anticipated to be impacted by forest management or conversion (see Forest Management and Forest Conversion, above of this rule for more details), we revised the buffer around the known maternity roost trees. As explained in more detail under *Conservation Measure 2: Tree Removal Near Known Maternity Roost Trees,* we have made the buffer more broadly applicable to all tree-removal activities, but have narrowed it in size to provide protection for the maternity roost tree, while minimizing the potential that the protective measure would serve as impediment to conducting new surveys. We have reduced the buffer around known, occupied maternity roost trees to a radius of 150 feet around the known, occupied maternity roost tree.

44. *Comment:* Commenter(s) stated that the Service should require surveys to determine where roost trees are located.

Our Response: The Act does not require a private landowner to survey his or her property to determine whether endangered or threatened wildlife and plants occupy their land. We encourage landowners to voluntarily seek additional information to conserve natural resources in their land use/land management actions; however, we will not require surveys to locate northern long-eared bats and maternity roost trees on private property.

Residential Housing Development

45. *Comment:* Commenter(s) requested that northern long-eared bat take be excepted for the purposes of residential housing development.

Our Response: Take resulting from removal of summer habitat (tree removal) is not prohibited provided the conservation measures set forth in this rule are followed when the habitat removal occurs within the WNS zone. The provisions of this final rule have been restructured to clarify prohibitions rather than rely on a list of excepted activities.

Wind Energy Development

46. *Comment:* Commenter(s) requested that northern long-eared bat take be excepted for the purposes of renewable energy development and operation (wind energy).

Our Response: Incidental take resulting from wind energy development and operation is not prohibited, provided that the conservation measures set forth in this rule are followed to protect hibernacula and known, occupied maternity roost trees. We strongly encourage voluntary conservation measures and best management practices such as feathering or elevated cut-in speeds to reduce impacts to northern long-eared bats and other bats; however, we have not prohibited incidental take attributable to wind energy in this final rule. Please see the Wind Energy Facilities section of this rule for additional details.

Natural Resource Management

47. *Comment:* Commenter(s) requested that northern long-eared bat take be excepted when activities are included in Department of Defense integrated natural resource management plans, providing for activities such as recreational activities, burns, and other temporary but insignificant effects on the northern long-eared bat.

Our Response: Incidental take resulting from activities described as recreational activities and beneficial wildlife habitat management/maintenance is not prohibited, provided that the conservation measures set forth in this rule are followed when the activity occurs inside the WNS zone. We have completed a section 7 analysis on the provisions of this final 4(d) rule to ensure that actions completed in accordance with the final rule are not likely to jeopardize the continued existence of the species. Where these resource management activities do not fit within the final rule, section 7 consultation would need to be

completed to authorize incidental take of the northern long-eared bat.

Compliance and Monitoring

48. *Comment:* Commenter(s) recommended that surveys be required and that landowners be required to report on their activities in order to receive the benefits of the 4(d) rule.

Our Response: While we welcome landowners' efforts to determine where bats may be located on their property, the Act does not require that a landowner survey his or her property to find species. We are not mandating that surveys be completed as part of this rule.

Alternate Section 4(d) Provisional Language

49. *Comment:* One organization commented on behalf of its members and 14 other environmental organizations (collectively referenced as ''the Center'') in support of the adoption of a different 4(d) rule and in opposition of the Service's proposed and the interim 4(d) rules.

Our Response: The remaining paragraphs (under the heading Summary of Comments and Recommendations on the Proposed and Interim4(d) Rules) pertain to the comments we received from the Center. With respect to the overarching comment that our 4(d) rule does not conserve the species, we believe that our final 4(d) rule provides for the ''necessary and advisable'' conservation of the species, as described herein. For further information, please see our Determination section, below.

With respect to the Center's proposed 4(d) language, we note that the proposed language defines specific prohibitions and would make a regulatory determination of ''take'' to include a number of actions. These include cave and mine entry without implementing decontamination protocols; transporting equipment into caves and mines or between caves and mines between the WNS zone and non-WNS zone; cave and mine entry during hibernation periods; activities associated with hydraulic fracturing within 5 miles of a hibernaculum, within 1.5 miles of an occupied roost tree, or within 3 miles of an acoustic detection or bat capture record; noise disturbance activities within a 0.5-mile radius of a hibernaculum during the hibernation period; and disruption of water sources within hibernacula. With respect to protection of hibernacula, take of northern long-eared bats is prohibited. Establishing the causal connection between a variety of activities such as those the Center proposed to be defined as prohibitions is beyond the scope of this rule. We have addressed hibernacula protection provisions in this rule under the section entitled *Conservation Measure 1: Tree Removal Near Known Northern Long-eared Bat Hibernacula.* Protections in this final rule are adequate to protect the species.

In addition to the Center's suggested language for hibernacula prohibitions, they recommended language regarding prohibitions for prescribed burning and aerial spraying. Based on our analysis, we conclude that prescribed burning and aerial spraying do not have a measurable population-level impact on the species and regulation of those activities will not meaningfully impact the species' ability to recover. For further information on prescribed fire impacts, see Prescribed Fire above. For further information on aerial spraying of pesticides, please see the Environmental Contaminants section above.

The final prohibition suggested by the Center was the operation of utility-scale wind projects, specifically during the hours from dusk to sunrise during the fall swarming season, at low wind speeds, and within 5 miles of a hibernaculum. Incidental take resulting from the operation of wind energy facilities is not prohibited by this final 4(d) rule and a complete discussion of known impacts to the species may be found in the Wind Energy Facilities section above.

Finally, the Center provided suggested regulatory text for exemptions from prohibitions that included language for seasonal restrictions, clearing restrictions, mandatory measures for hibernacula protection (gate installation), water quality protection measures, and data collection and reporting requirements. We recognize the effort that has gone into the development of this alternative language. However, we have carefully considered the measures that are necessary for the protection of the species. Our final rule has been developed based on the Service's desire to implement protective measures that will make a meaningful impact on species conservation and recovery. As stated elsewhere in this document (see Determination section, below), we have provided regulatory flexibility while implementing protective measures where we have determined those measures to be necessary and advisable for conservation of the species.

Determination

Section 4(d) of the Act states that ''the Secretary shall issue such regulations as she deems 'necessary and advisable to provide for the conservation' '' of species listed as threatened species. Conservation is defined in the Act to mean ''to use and the use of all methods and procedures which are necessary to bring any endangered species or threatened species to the point at which the measures provided pursuant to [the Act] are no longer necessary.''

The courts have recognized the extent of the Secretary's discretion under this standard to develop rules that are appropriate for the conservation of a species. For example, the Secretary may find that it is necessary and advisable not to include a taking prohibition, or to include a limited taking prohibition. See Alsea Valley Alliance v Lautenbacher, 2007 U.S. Dist. Lexis 60203 (D. Or. 2007); Washington Environmental Council v. National Marine Fisheries Service, 2002 U.S. Dist. Lexis 5432 (W.D. Wash. 2002). In addition, as affirmed in State of Louisiana v. Verity, 853 F. 2d 322 (5th Cir. 1988), the rule need not address all the threats to the species. As noted by Congress when the Act was initially enacted, ''once an animal is on the threatened list, the Secretary has an almost infinite number of options available to him [her] with regard to the permitted activities for those species. [She] may, for example, permit taking, but not importation of such species,'' or she may choose to forbid both taking and importation but allow the transportation of such species, as long as the prohibitions, and exceptions to those prohibitions, will ''serve to conserve, protect, or restore the species concerned in accordance with the purposes of the Act'' (H.R. Rep. No. 412, 93rd Cong., 1st Sess. 1973).

Section 9 prohibitions make it illegal for any person subject to the jurisdiction of the United States to violate any regulation pertaining to any threatened species of fish or wildlife listed pursuant to section 4 of the Act and promulgated by the Secretary pursuant to authority provided by the Act. Under this final 4(d) rule, incidental take of the northern long-eared bat will not be prohibited outside the WNS zone. Incidental take also will not it be prohibited within the WNS zone, outside of hibernacula, provided that it occurs more than 0.25 miles (0.4 km) from a known hibernacula and does not result from an activity that cuts or destroys known occupied maternity roost trees, or any other trees within a 150-foot (45-m) radius from the maternity tree, during the pup season (June 1 through July 31).

Accordingly, we have determined that this provision is necessary and advisable for the conservation of the northern long-eared bat as explained below.

Although not fully protective of every individual, the conservation measures identified in this final rule help protect maternity colonies. This final species-specific rule under section 4(d) of the Act provides the flexibility for certain activities to occur that have not been the cause of the species' imperilment, while still promoting conservation of the species across its range.

The northern long-eared bat was listed as a threatened species under the Act, with an interim rule under section 4(d), on April 2, 2015 (80 FR 17974). At that time, the Service invited public comment on the interim 4(d) rule for 90 days, ending July 1, 2015. The Service had already received comments for 60 days on its proposed 4(d) rule (80 FR 2371; January 16, 2015). In total, the Service received approximately 40,500 comments on the proposed and interim 4(d) rules. For a complete discussion of the comments, as well as the Service's response to comments, see Summary of Comments and Recommendations on the Proposed and Interim 4(d) Rules, above.

Because the primary threat to the northern long-eared bat is a fungal disease known as WNS, the Service has tailored the final 4(d) rule to prohibit the take of northern long-eared bats from certain activities within areas where they are in decline, as a result of WNS, and within these areas we apply incidental take protection only to known, occupied maternity roost trees and known hibernacula. These protections will help to conserve the northern long-eared bat during its most vulnerable life stages (from birth to flight, or volancy) and during spring and fall swarming (near hibernacula).

In summary, this 4(d) rule is necessary and advisable to provide for the conservation of the northern long-eared bat because it provides for protection of known maternity roost trees and known hibernacula within the WNS zone. In addition, promulgation of this rule allows the conservation community to provide for species conservation where it can affect change, namely during the northern long-eared bat's most vulnerable life stages and where hibernation occurs. This final 4(d) rule allows the regulated public to manage lands in a manner that is lawful and compatible with species' survival, and it allows for protection of the species in a manner that the Secretary deems to be necessary and advisable for the conservation of the northern long-eared bat. By this rule, the Secretary deems that the prohibition of certain take, which is incidental to otherwise lawful activities that take bat habitat, is not necessary for the long-term survival of the species. Furthermore, she acknowledges the importance of addressing the threat of WNS as the primary measure to arrest and reverse the decline of the species. Nothing in this 4(d) rule affects other provisions of the Act, such as designation of critical habitat under section 4, recovery planning under section 4(f), and consultation requirements under section 7.

Required Determinations

Regulatory Planning and Review

(Executive Orders 12866 and 13563)

Executive Order 12866 provides that the Office of Information and Regulatory Affairs (OIRA) in the Office of Management and Budget will review all significant rules. OIRA has determined that this rule is not significant. Executive Order 13563 reaffirms the principles of E.O. 12866 while calling for improvements in the nation's regulatory system to promote predictability, to reduce uncertainty, and to use the best, most innovative, and least burdensome tools for achieving regulatory ends. The executive order directs agencies to consider regulatory approaches that reduce burdens and maintain flexibility and freedom of choice for the public where these approaches are relevant, feasible, and consistent with regulatory objectives. E.O. 13563 emphasizes further that regulations must be based on the best available science and that the rulemaking process must allow for public participation and an open exchange of ideas. We have developed this final 4(d) rule in a manner consistent with these requirements.

Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*)

Listing and status determinations under the Endangered Species Act of 1973, as amended (Act; 16 U.S.C. 1531 *et seq.*), and any prohibitions or protective measures afforded the species under the Act are exempt from the Regulatory Flexibility Act (RFA; 5 U.S.C. 601 *et seq.,* as amended by the Small Business Regulatory Enforcement Fairness Act (SBREFA) of 1996). However, as this final 4(d) rule is being promulgated following the final listing of the northern long-eared bat, we evaluate whether the Regulatory Flexibility Act applies to this rulemaking.

Under the Regulatory Flexibility Act, whenever an agency must publish a notice of rulemaking for any proposed or final rule, it must prepare and make available for public comment a regulatory flexibility analysis that describes the effects of the rule on small entities (small businesses, small organizations, and small government jurisdictions). However, no regulatory flexibility analysis is required if the head of the agency certifies the rule will not have a significant economic impact on a substantial number of small entities. SBREFA amended the RFA to require Federal agencies to provide a statement of the factual basis for certifying that the rule will not have a significant economic impact on a substantial number of small entities. Thus, for a regulatory flexibility analysis to be required, impacts must exceed a threshold for ''significant impact'' and a threshold for a ''substantial number of small entities.'' See 5 U.S.C. 605(b). Based on the information that is available to us at this time, we certify that this rule will not have a significant economic impact on a substantial number of small entities. The following discussion explains our rationale.

On April 2, 2015 (80 FR 17974), we published the final determination to list the northern long-eared bat as a threatened species and an interim 4(d) rule. That rule became effective on May 4, 2015, and the interim 4(d) rule will remain in effect until this final rule becomes effective (see **DATES**, above). The interim 4(d) rule generally applies the prohibitions of 50 CFR 17.31 and 17.32 to the northern long-eared bat, which means that the interim rule, among other things, prohibits the purposeful take of northern long-eared bats throughout the species' range, but the interim rule includes exceptions to the purposeful take prohibition. The exceptions for purposeful take are: (1) In instances of removal of northern long-eared bats from human structures (if actions comply with all applicable State regulations); and (2) for authorized capture, handling, and related activities of northern long-eared bats by individuals permitted to conduct these same activities for other bat species until May 3, 2016. Under the interim rule, incidental take is not prohibited outside the WNS zone if the incidental take results from otherwise lawful activities. Inside the WNS zone, there are exceptions for incidental take for the following activities, subject to certain conditions: Implementation of forest management; maintenance and expansion of existing rights-of-way and transmission corridors; prairie management; minimal tree removal; and removal of hazardous trees for the protection of human life and property.

This final 4(d) rule does not generally apply the prohibitions of 50 CFR 17.31 to the northern long-eared bat. This rule continues to prohibit purposeful take of

northern long-eared bats throughout the species' range, except in certain cases, including in instances of removal of northern long-eared bats from human structures and for authorized capture, handling, and related activities of northern long-eared bats by individuals permitted to conduct these same activities for other bat species until May 3, 2016. After May 3, 2016, a permit pursuant to section 10(a)(1)(A) of the Act is required for the capture and handling of northern long-eared bats. Under this rule, incidental take is still not prohibited outside the WNS zone. Within the WNS zone, incidental take is prohibited only if: (1) Actions result in the incidental take of northern long-eared bats in hibernacula; (2) actions result in the incidental take of northern long-eared bats by altering a known hibernaculum's entrance or interior environment if the alteration impairs an essential behavioral pattern, including sheltering northern long-eared bats; or (3) tree-removal activities result in the incidental take of northern long-eared bats when the activity either occurs within 0.25 mile (0.4 kilometer) of a known hibernaculum, or cuts or destroys known, occupied maternity roost trees or any other trees within a 150-foot (45-meter) radius from the maternity roost tree during the pup season (June 1 through July 31). This approach allows more flexibility to affected entities and individuals in conducting activities within the WNS zone. Under this rule, we individually set forth prohibitions on possession and other acts with unlawfully taken northern long-eared bats, and on import and export of northern long-eared bats. These prohibitions were included in the interim 4(d) through the general application of the prohibitions of 50 CFR 17.31 to the northern long-eared bat. Under this rule, take of the northern long-eared bat is also not prohibited for the following: Removal of hazardous trees for protection of human life and property; take in defense of life; and take by an employee or agent of the Service, of the National Marine Fisheries Service, or of a State conservation agency that is operating a conservation program pursuant to the terms of a cooperative agreement with the Service. Regarding these three exceptions, take in defense of life was not included in the interim 4(d) rule, but the other two exceptions were, either through the general application of 50 CFR 17.31 or through a specific exception included in the interim 4(d) rule. Therefore, this final 4(d) rule will result in less restrictive regulations under the Act than those set forth in the interim 4(d) rule.

We completed an analysis of the forested land area that may be impacted by this rulemaking. There are approximately 400,000,000 acres (161,874,256 ha) of forested habitat across the range of the northern long-eared bat, which includes 37 States and the District of Columbia. This rule may restrict land use activities on approximately 200,000 acres (80,937 ha). This area constitutes less than 0.05 percent of all forested habitat across the extensive range of the northern long-eared bat. Any impact in this very small portion of forested habitat is not expected to affect a substantial number of entities in any given sector, nor result in a significant economic impact on any given entity. For the above reasons, we certify that the final rule will not have a significant economic impact on a substantial number of small entities. Therefore, a final regulatory flexibility analysis is not required.

Energy Supply, Distribution, or Use—Executive Order 13211

Executive Order 13211 (Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use) requires agencies to prepare Statements of Energy Effects when undertaking certain actions. For reasons discussed within this final rule, we believe that the rule will not have any effect on energy supplies, distribution, or use. Therefore, this action is not a significant energy action, and no Statement of Energy Effects is required.

Unfunded Mandates Reform Act

In accordance with the Unfunded Mandates Reform Act (2 U.S.C. 1501 *et seq.*), we make the following findings:

(1) This final rule will not produce a Federal mandate. In general, a Federal mandate is a provision in legislation, statute, or regulation that would impose an enforceable duty upon State, local, or Tribal governments, or the private sector, and includes both ''Federal intergovernmental mandates'' and ''Federal private sector mandates.'' These terms are defined in 2 U.S.C. 658(5)–(7). ''Federal intergovernmental mandate'' includes a regulation that ''would impose an enforceable duty upon State, local, or [T]ribal governments'' with two exceptions. It excludes ''a condition of Federal assistance.'' It also excludes ''a duty arising from participation in a voluntary Federal program,'' unless the regulation ''relates to a then-existing Federal program under which $500,000,000 or more is provided annually to State, local, and [T]ribal governments under entitlement authority,'' if the provision would ''increase the stringency of conditions of assistance'' or ''place caps upon, or otherwise decrease, the Federal Government's responsibility to provide funding,'' and the State, local, or Tribal governments ''lack authority'' to adjust accordingly. At the time of enactment, these entitlement programs were: Medicaid; AFDC work programs; Child Nutrition; Food Stamps; Social Services Block Grants; Vocational Rehabilitation State Grants; Foster Care, Adoption Assistance, and Independent Living; Family Support Welfare Services; and Child Support Enforcement. ''Federal private sector mandate'' includes a regulation that ''would impose an enforceable duty upon the private sector, except (i) a condition of Federal assistance or (ii) a duty arising from participation in a voluntary Federal program.''

(2) This final 4(d) rule will result in less restrictive regulations under the Act, as it pertains to the northern long-eared bat, than would otherwise exist without a 4(d) rule or under the interim 4(d) rule. As a result, we do not believe that this rule will significantly or uniquely affect small government entities. Therefore, a Small Government Agency Plan is not required.

Takings

In accordance with Executive Order 12630, this final rule will not have significant takings implications. We have determined that the rule has no potential takings of private property implications as defined by this Executive Order because this 4(d) rule will result in less-restrictive regulations under the Act than would otherwise exist. A takings implication assessment is not required.

Federalism

In accordance with Executive Order 13132, this final 4(d) rule does not have significant Federalism effects. A federalism summary impact statement is not required. This rule will not have substantial direct effects on the State, on the relationship between the Federal Government and the State, or on the distribution of power and responsibilities among the various levels of government.

Civil Justice Reform

In accordance with Executive Order 12988, the Office of the Solicitor has determined that this final rule does not unduly burden the judicial system and meets the requirements of sections 3(a) and 3(b)(2) of the Order.

Paperwork Reduction Act of 1995 (44 U.S.C. 3501 et seq.)

This rule does not contain collections of information that require approval by the Office of Management and Budget (OMB) under the Paperwork Reduction Act. This rule will not impose recordkeeping or reporting requirements on State or local governments, individuals, businesses, or organizations. An agency may not conduct or sponsor and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number.

National Environmental Policy Act (42 U.S.C. 4321 et seq.)

We have prepared a final environmental assessment, as defined under the authority of the National Environmental Policy Act of 1969. For information on how to obtain a copy of the final environmental assessment, see **ADDRESSES**, above. The final environmental assessment will also be available on the Internet at *http://www.regulations.gov* and at *http://www.fws.gov/midwest/Endangered.*

Government-to-Government Relationship With Tribes

In accordance with the President's memorandum of April 29, 1994 (Government-to-Government Relations with Native American Tribal Governments; 59 FR 22951), Executive Order 13175 (Consultation and Coordination With Indian Tribal Governments), and the Department of the Interior's manual at 512 DM 2, we readily acknowledge our responsibility to communicate meaningfully with recognized Federal Tribes on a government-to-government basis. In accordance with Secretarial Order 3206 of June 5, 1997 (American Indian Tribal Rights, Federal-Tribal Trust Responsibilities, and the Endangered Species Act), we readily acknowledge our responsibilities to work directly with tribes in developing programs for healthy ecosystems, to acknowledge that tribal lands are not subject to the same controls as Federal public lands, to remain sensitive to Indian culture, and to make information available to tribes.

In October 2013, Tribes and multi-tribal organizations were sent letters inviting them to begin consultation and coordination with the service on the proposal to list the northern long-eared bat. In August 2014, several Tribes and multi-tribal organizations were sent an additional letter regarding the Service's intent to extend the deadline for making a final listing determination by 6 months. A conference call was also held with Tribes to explain the listing process and discuss any concerns. Following publication of the proposed rule, the Service established three interagency teams (biology of the northern long-eared bat, non-WNS threats, and conservation measures) to ensure that States, Tribes, and other Federal agencies were able to provide input into various aspects of the listing rule and potential conservation measures for the species. Invitations for inclusion in these teams were sent to Tribes within the range of the northern long-eared bat and a few tribal representatives participated on those teams. Two additional conference calls (in January and March 2015) were held with Tribes to outline the proposed species-specific 4(d) rule and to answer questions. Through this coordination, some Tribal representatives expressed concern about how listing the northern long-eared bat may impact forestry practices, housing development programs, and other activities on Tribal lands.

List of Subjects in 50 CFR Part 17

Endangered and threatened species, Exports, Imports, Reporting and recordkeeping requirements, Transportation.

Regulation Promulgation

Accordingly, we amend part 17, subchapter B of chapter I, title 50 of the Code of Federal Regulations, as follows:

PART 17—ENDANGERED AND THREATENED WILDLIFE AND PLANTS

■ 1. The authority citation for part 17 continues to read as follows:

Authority: 16 U.S.C. 1361–1407; 1531–1544; and 4201–4245, unless otherwise noted.

■ 2. Amend § 17.40 by revising paragraph (o) to read as follows:

§ 17.40 Special rules—mammals.

* * * * *

(o) Northern long-eared bat (*Myotis septentrionalis*). The provisions of this rule are based upon the occurrence of white-nose syndrome (WNS), a disease affecting many U.S. bat populations. The term ''WNS zone'' identifies the set of counties within the range of the northern long-eared bat within 150 miles of the boundaries of U.S. counties or Canadian districts where the fungus *Pseudogymnoascus destructans* (*Pd*) or WNS has been detected. For current information regarding the WNS zone, contact your local Service ecological services field office. Field office contact information may be obtained from the Service regional offices, the addresses of which are listed in 50 CFR 2.2.

(1) *Prohibitions.* The following prohibitions apply to the northern long-eared bat:

(i) Purposeful take of northern long-eared bat, including capture, handling, or other activities.

(ii) Within the WNS zone:

(A) Actions that result in the incidental take of northern long-eared bats in known hibernacula.

(B) Actions that result in the incidental take of northern long-eared bats by altering a known hibernaculum's entrance or interior environment if it impairs an essential behavioral pattern, including sheltering northern long-eared bats.

(C) Tree-removal activities that result in the incidental take of northern long-eared bats when the activity:

(*1*) Occurs within 0.25 mile (0.4 kilometer) of a known hibernaculum; or

(*2*) Cuts or destroys known occupied maternity roost trees, or any other trees within a 150-foot (45-meter) radius from the maternity roost tree, during the pup season (June 1 through July 31).

(iii) Possession and other acts with unlawfully taken northern long-eared bats. It is unlawful to possess, sell, deliver, carry, transport, or ship, by any means whatsoever, any northern long-eared bat that was taken in violation of this section or State laws.

(iv) Import and export.

(2) *Exceptions from prohibitions.* (i) Any person may take a northern long-eared bat in defense of his own life or the lives of others, including for public health monitoring purposes.

(ii) Any person may take a northern long-eared bat that results from the removal of hazardous trees for the protection of human life and property.

(iii) Any person may take a northern long-eared bat by removing it from human structures, but only if the actions comply with all applicable State regulations.

(iv) Purposeful take that results from actions relating to capture, handling, and related activities for northern long-eared bats by individuals permitted to

conduct these same activities for other species of bat until May 3, 2016.

(v) All of the provisions of § 17.32 apply to the northern long-eared bat.

(vi) Any employee or agent of the Service, of the National Marine Fisheries Service, or of a State conservation agency that is operating a conservation program pursuant to the terms of a cooperative agreement with the Service in accordance with section 6(c) of the Act, who is designated by his agency for such purposes, may, when acting in the course of his official duties, take northern long-eared bats covered by an approved cooperative agreement to carry out conservation programs.

Developed land is the dominant land use within the watersheds. Additional information regarding land use is provided in Section 3.1, Social/Economic Characteristics. Studies have shown that the biological quality of streams may be impacted if the percentage of urban land use within a watershed exceeds between 10 and 30 percent (Midwest Biodiversity Institute, 2008). The total area of developed land in the sub-watersheds varies from 76 to 91 percent.

Summary of Land Use by Watershed

Land Use	Watershed [a]									
	Addison Creek		Upper Des Plaines River [b]		Lower Des Plaines River (Main Stem)		Salt Creek		South Branch of the Chicago River [c]	
	acres	%	acres	%	acres	%	acres	%	acres	%
Agricultural	1	0	90,553	29.3	46	0	1,159	1.2	0	0
Commercial	1,130	7	13,852	4.5	1,962	7	9,325	10.0	5,914	10
Industrial	2,481	16	14,824	4.8	3,399	12	6,501	7.0	7,539	13

Source: IEPA data obtained from the EPA STORET database, 2012; DRSCW, 2010-for Salt Creek data (River Mile 10.5); Metropolitan Water Reclamation District of Greater Chicago (MWRDGC)

Notes: mg/L = milligrams per liter, ºC = degrees Celsius, s.u. = standard unit. ND – Not Detected, Shaded are sample result(s) exceed(s) the General Use Water Quality Standard

Measured levels of parameters in this table generally are the range of all STORET data, unless otherwise noted.

a. STORET data is not available for G_32 of Des Plaines River, G_39, immediately downstream of G_32 is reported.

b. General Use Water Quality Standards are provided (from Illinois Administrative Code, Title 35, Part 302), unless otherwise noted. The dissolved metal standard is calculated based on equations in Section 302, Water Quality Standards. Refer to the Illinois Administrative Code for additional information.

c. Measurement represents the minimum DO concentration from all sampling events. The month and year of the lowest measurement was taken is provided.

d. A total of eight samples exceed the General Use Water Quality Standards.

e. A total of two STORET samples exceed the General use Water Quality Standards.

MWRDGC data from 2005 to 2012 reported 5 of 87 samples above 500 mg/L at Roosevelt Rd site.

f. Measurement represents the maximum temperature from all sampling events. The month and year of the highest measurement was taken is provided.

g. IEPA reported a maximum chloride concentration of 867 mg/L on March 11, 1999 at the Salt Creek Station (USGS 05531500); six miles downstream from project corridor (IEPA, 2004). MWRDGC data reported 5 of 89 samples above 500 mg/L at Wolf Rd.

h MWRDGC reported a chloride concentration of 525 mg/L in February 2010. Only 2 of 82 samples exceeded 500 mg/L from January 2005 to July 2012.

i After July 1, 2018, the water quality standard in effect for chlorides would be 500 mg/L and the Total Dissolved Solids water quality standard will be repealed.

Appendix I

Section 4(f) Correspondence

I-290 Eisenhower Expressway
Cook County, Illinois

Since the publication of the DEIS, Appendix I was updated to include the following:

- Changed title from Columbus Park Correspondence to Section 4(f) Correspondence;
- Added letters of concurrence from Chicago Park District, Village of Forest Park and Park District of Forest Park; and
- Added SHPO Section 4(f) exception concurrence letter.

Pete Harmet
IDOT
201 W. Center Ct.
Schaumburg, IL. 60196

Dear Mr. Harmet:

I am writing as a follow up to the meeting we had with representatives of IDOT and members of our staff at the Planning and Construction Department at the Chicago Park District on August 19, 2015 regarding Columbus Park and the I-290 Project.

Based upon the information provided at the meeting, the CPD has determined that the I-290 project would have no adverse effect upon Columbus Park. The CPD supports the multi-use trail connection at Austin Boulevard, and concurs with a temporary easement to construct the path, which would be donated to IDOT.

Further coordination, especially with respect to the path alignment and landscaping, is needed prior to finalizing the actual design in this area of the park. The CPD desires enhanced landscaping along south edge of the property, and would donate a temporary easement to IDOT to accomplish this work. Further coordination is needed, especially with IHPA, prior to finalizing a landscaping plan.

We all agree that this project will not result in an adverse effect and also believe that there is an opportunity to enhance the park's historic integrity that should not be missed. We would like the scope of work to include new berms with tree and shrub plantings along the south perimeter of the park. We hope that the project can also address drainage issues at the park's southeast corner. We are open to working with your team to develop an appropriate plaza treatment at the southwestern edge of the park. We think these improvements will be especially beneficial to pedestrians and bicyclists using the trail along the southern part of the park.

I have discussed this proposal with Rachel Leibowitz of the IHPA and she concurs that if designed well, this work would enhance the historic integrity of the park. She is willing to consult with the team and the project moves into a design phase. Thank you for your consideration on this matter.

Sincerely,

Julia S. Bachrach

February 27, 2017

The Honorable Anthony T. Calderone
Mayor
Village of Forest Park
517 Des Plaines Avenue
Forest Park, IL 60130

Dear Mayor Calderone:

The purpose of this letter is to request concurrence from the Village of Forest Park (Village) with respect to proposed I-290 construction activities affecting two parks located within the Village limits. As discussed at the meetings on October 15, 2015, January 21, 2016 and October 27, 2016 (meeting minutes attached) we have prepared and released an Environmental Impact Statement for the reconstruction of I-290 from west of Mannheim Road to Racine Avenue. The proposed scope of work on I-290 in the Forest Park area includes complete reconstruction of the expressway including the replacement of the bridge carrying Circle Avenue over I-290.

In the vicinity of I-290, the Village has parks and other recreational uses located at Circle Avenue on property that was purchased by Cook County for the original construction of I-290 and associated cross-streets and frontage roads. It is our understanding that the Village has been leasing these properties from the County. However, based upon coordination with the County and the Village, no lease agreements have been found to date.

The attached exhibits provide information on the I-290 improvements relative to Veterans Park and the Dog Park located on either side of Circle Avenue at Lehmer Street. In particular, reconstruction of Circle Avenue over I-290 will require permanent use and temporary construction easements for the widening of the Circle Avenue bridge and approaches to include wider sidewalks, 6' wide bicycle paths and a wider pavement area for a transit kiss and ride. These elements of the project were requested by the Village and/or the CTA in order to improve mobility across the bridge and accessibility to the transit station. The Department is utilizing retaining walls to contain fill areas and prevent further intrusion into the parks. However, some encroachment is necessary to fully implement these features. Temporary construction easements are also needed to allow for working space during construction.

Although the parks are situated on County property obtained for the original I-290 construction, they are protected by Section 4(f) of the U.S. Department of Transportation Act of 1966 due to their recreational use. Based upon the coordination with the Village thus far, the I-290 project will not adversely affect the activities, features, or attributes of these properties. As a result, IDOT intends to seek a "de minimis" impact finding from the Federal Highway Administration based on this project not adversely affecting the features, attributes, or activities qualifying this property for protection under Section 4(f). In this regard, we are requesting written concurrence from the Village that the proposed improvements will not adversely affect the recreational activities, features and attributes of Veterans Park and the Dog Park.

The work to be performed in the parks, as described herein, was presented during the I-290 Public Hearings on January 25, 2017 at the Proviso Math and Science Academy in Forest Park, and on January 26, 2017 at the Marriott Hotel-Medical District in Chicago. No comments were received at the public hearings regarding adverse effects to the activities, features, or attributes at either of the two parks as a result of the I-290 Project, although the US Department of the Interior (DOI) submitted correspondence which is attached for your reference. The Department will be coordinating with the DOI in the near future to discuss their comments.

If the Village agrees with the "de minimis" finding for the parks, please indicate your concurrence in the space provided below and return one copy to this office in the enclosed stamped, self-addressed envelope. With Village concurrence, the FHWA would issue a "de minimis" impact finding for the project as part of the Final Environmental Impact Statement/Record of Decision.

If you have any questions or need additional information, please contact me or Pete Harmet, Bureau Chief of Programming, at (847) 705-4393.

Very truly yours,

Anthony J. Quigley, P.E.
Region One Engineer

Comments:

Illinois Department of Transportation
Office of Highways Project Implementation / Region 1 / District 1
201 West Center Court / Schaumburg, Illinois 60196-1096

March 13, 2017

Mr. Larry Piekarz
Executive Director
Park District of Forest Park
7501 Harrison Street
Forest Park, IL 60130

Dear Mr. Piekarz:

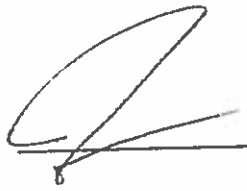
The purpose of this letter is to request concurrence from the Park District of Forest Park (Park District) with respect to proposed I-290 construction activities affecting proposed park improvements on Park District property. As discussed at our October 27, 2016 meeting (minutes attached) we have prepared a Draft Environmental Impact Statement (DEIS) for the reconstruction of I-290 from west of Mannheim Road to Racine Avenue. The proposed scope of work on I-290 includes complete reconstruction of the I-290 expressway including replacement of the bridge carrying Circle Avenue over I-290.

The attached exhibit provides information on the I-290 improvements relative to the Park District property located along the west side of Circle Avenue between I-290 and Harrison Street. In particular, the Circle Avenue bridge and approach roadways will be widened to accommodate wider sidewalks and bike paths as requested by the Village. Although the Department is utilizing retaining walls to contain roadway fill areas and prevent intrusion into the park, a temporary easement is needed along Park District property (the Roos property) to allow for working space during construction. Once construction is completed, the Department will vacate the easement and restore the Park District property to its previous condition.

As you know, Park District property is protected by Section 4(f) of the U.S. Department of Transportation Act of 1966 due to its recreational use. Based upon the coordination with the District thus far, the I-290 project will not adversely affect use of this property. As a result, IDOT intends to seek a "de minimis" impact finding from the Federal Highway Administration based on this project not adversely affecting the activities, features, or attributes qualifying this property for protection under Section 4(f). In this regard, we are requesting written concurrence from the Park District that the proposed temporary easement will not adversely affect the recreational activities, features, or attributes of the Park District Property. With Park District concurrence, the FHWA would issue a "de minimis" impact finding for the project as part of the Final EIS/Record of Decision.

If the Park District agrees with the "de minimis" finding as described, please indicate your concurrence in the space provided below and return one copy to this office in the enclosed stamped, self-addressed envelope by March 31, 2017 in order to maintain the project schedule. The work to be performed in the parks as described herein was presented during the Public Hearings on January 25, 2017 and January 26, 2017 at the Proviso Math and Science Academy in Forest Park and the Chicago Marriott Hotel - Medical District in Chicago. No comments were received at the public hearings regarding adverse effects to the activities, features, or attributes at this park as a result of the I-290 project, although the US Department of the Interior (DOI) submitted general comments which are attached for your reference. The Department will be coordinating with the DOI in the near future to discuss their comments.

If you have any questions or need additional information, please contact me or Pete Harmet, Bureau Chief of Programming, at (847) 705-4393.



Very truly yours,

RE: Section 4(f) Exception

Dr. Rachel Leibowitz
Deputy State Historic Preservation Officer
Illinois Historic Preservation Agency
1 Old State Capitol Plaza
Springfield, IL 62701

Dear Dr. Leibowitz:

In further consultation with your office, the Illinois Department of Transportation (IDOT) in coordination with the Federal Highway Administration (FHWA) is currently performing preliminary engineering and environmental studies for the planned improvement of I-290 from Mannheim Road to Racine Avenue. Your office concurred June 25, 2017 with the IDOT finding that the undertaking will have no adverse effect on Columbus Park or other historic properties (letter attached). The undertaking is not currently included in IDOT's FY 2017-2022 Proposed Highway Improvement Program. At this time only Phase I (planning) is funded. The undertaking, however, does represent a high priority for future funding consideration.

The purpose of this letter is to request your concurrence that the construction activities within Columbus Park, a National Historic Landmark, would enhance the property and would therefore qualify as an exception for Section 4(f) approval. As an historic property, the State Historic Preservation Officer (SHPO) is considered an "official with jurisdiction" over Columbus Park and to apply the exception to Section 4(f), we must obtain your agreement that the exception criteria have been satisfied.

The proposed improvement is anticipated to include an additional lane west of Austin Boulevard and conversion of an existing lane in each direction to a managed lane east of Austin Boulevard. The HOT 3+ managed lane alternative was identified as the preferred alternative in the Draft Environmental Impact Statement (DEIS). The preferred alternative stays primarily within existing right-of-way and only a minor amount of new right-of-way is needed near several

interchanges. No permanent right-of-way is required from Columbus Park, and no displacements are required in the corridor.

IDOT developed an east-west shared-use path concept that would be constructed as part of the I-290 improvements. The path would provide connectivity from the Illinois Prairie Path on the west to Columbus Park on the east. The path connection from Austin Boulevard to the existing Columbus Park Trail System would be constructed with the understanding that the Chicago Park District approved the connection and donated a temporary easement for construction of the connection. During coordination with the Chicago Park District, additional trail improvements were requested at the east end of Columbus Park to capitalize on the proximity of project-related construction activities, materials, and equipment.

As discussed in a meeting with the Chicago Park District on November 18, 2016 and April 27, 2017, the proposed shared-use path connection will require a temporary easement from the Columbus Park (to be processed as an access permit with the Chicago Park District). As this project will utilize federal funds, Columbus Park is considered a Section 4(f) property eligible for protection under federal regulations 23 U.S.C. 138 and 49 U.S.C. 303, which were originally enacted as Section 4(f) of the Department of Transportation Act of 1966 and are still commonly referred to as "Section 4(f)." Section 4(f) protects publicly-owned parks, recreation areas, wildlife and waterfowl refuges, and historic properties on US DOT projects. The Chicago Park District is also an "official with jurisdiction" over Columbus Park.

The west-end trail connection concept includes a 450-foot shared-use path connection and several earthen berms which would be constructed on park property between Austin Boulevard and the existing Columbus Park path. At this early stage of Phase I project development, it is anticipated that the Department may need to temporarily close the trail at the tie-in of the west end path. The closure is anticipated to temporarily impact trail activities for a span of two to three days.

At the east end, the Chicago Park District requested improvements to the existing trail, grading to address drainage issues, and construction of new berms to provide some screening of the expressway. It is anticipated that these improvements will require closure of the existing trail for approximately two weeks, during which time a temporary aggregate path can be utilized to provide continued connectivity.

The overall I-290 undertaking (roadway reconstruction and widening) is estimated to last a total of eight years during which time there will be no permanent impacts to or alteration of the trail, and access along the trail will be unaffected. While construction activities will occur within Columbus Park, we believe that an exception to Section 4(f) is applicable because the construction activities will enhance Columbus Park. An exception to the requirement for Section 4(f)

approval is described in 23 CFR Part 774.13(g) "Transportation Enhancement Projects and Mitigation Activities," which is applicable when the following criteria are satisfied:

(1) The use of the Section 4(f) property is solely for the purpose of preserving or enhancing an activity, feature, or attribute that qualifies the property for Section 4(f) protection; and

(2) The official(s) with jurisdiction over the Section 4(f) resource agree in writing to paragraph (g)(1) of this section.

Both FHWA and IDOT believe that the improvements proposed at Columbus Park qualify as an enhancement activity and have requested concurrence by the Chicago Park District that the undertaking meets the above exception for Section 4(f) approval. We have requested their response by June 7, 2017.

If your office agrees that the planned construction within Columbus Park satisfies the exception that the "*The use of the Section 4(f) property is solely for the purpose of preserving or enhancing an activity, feature, or attribute that qualifies the property for Section 4(f) protection",* please concurrence by June 7, 2017

Sincerely,

Brad H. Koldehoff

Project and Environmental Studies
FAI 290 (I-290)
US 12/20/45 (Mannheim Road) to Racine Avenue
Cook County

May 31, 2017

Ms. Heather Gleason
Director of Planning and Development
Chicago Park District
541 North Fairbanks
Chicago, IL 60611

Dear Ms. Gleason:

The Illinois Department of Transportation (Department) is currently performing preliminary engineering and environmental studies for the improvement of I-290 from Mannheim Road to Racine Avenue. This Project is not currently included in the Department's FY 2017-2022 Proposed Highway Improvement Program. At this time only Phase I (planning) is funded. This Project represents a high priority for future funding consideration.

The proposed improvement is anticipated to include an additional lane west of Austin Boulevard and conversion of an existing lane in each direction to a managed lane east of Austin Boulevard. The HOT 3+ managed lane alternative was identified as the preferred alternative in the Draft Environmental Impact Statement (DEIS). The preferred alternative stays primarily within existing right-of-way(ROW) and only a minor amount of new ROW is needed near several interchanges. No permanent ROW is required from Columbus Park, and no displacements are required in the corridor.

The Department developed an east-west shared-use path concept that would be constructed as part of the I-290 improvements. The path would provide connectivity from the Illinois Prairie Path on the west to Columbus Park on the east. The path connection from Austin Boulevard to the existing Columbus Park Trail System would be constructed with the understanding that the Chicago Park District approved the connection and donated a temporary easement for construction of the connection. During coordination with the Chicago Park District, additional trail improvements were requested at the east end of Columbus Park to capitalize on the proximity of project-related construction activities, materials and equipment.

As discussed in a meeting with the Chicago Park District on November 18, 2016 and April 27, 2017, the proposed shared-use path connection will require a temporary easement from the Columbus Park (to be processed as an access permit with the Chicago Park District). As this project will utilize federal funds, Columbus Park is considered a Section 4(f) property eligible for protection under federal regulations 23 U.S.C. 138 and 49 U.S.C. 303, which were originally enacted as Section 4(f) of the Department of Transportation Act of 1966 and are still commonly referred to as "Section 4(f)." Section 4(f) protects publicly-owned parks, recreation areas, and wildlife and waterfowl refuges on US DOT projects.

The west-end trail connection concept includes a 450-foot shared-use path connection and several earthen berms which would be constructed on park property between Austin Boulevard and the existing Columbus Park path. At this early stage of Phase I project development, it is anticipated that the Department may need to temporarily close the trail at the tie-in of the west end path. The closure is anticipated to temporarily impact trail activities for a span of two to three days.

At the east end, the Chicago Park District requested improvements to the existing trail, grading to address drainage issues, and construction of new berms to provide some screening of the expressway. It is anticipated that these improvements will require closure of the existing trail for a duration of approximately two weeks, during which time a temporary aggregate path can be utilized to provide continued connectivity.

The overall I-290 project (roadway reconstruction and widening) is estimated to last a total of eight years during which time there will be no permanent impacts to or alteration of the trail, and access along the trail will be unaffected.

While construction activities will occur within Columbus Park, we believe that an exception to Section 4(f) is applicable because the construction activities will enhance Columbus Park. An exception to the requirement for Section 4(f) approval is described in 23 CFR Part 774.13(g) "Transportation Enhancement Projects and Mitigation Activities," which is applicable when the following criteria are satisfied:

(1) The use of the Section 4(f) property is solely for the purpose of preserving or enhancing an activity, feature, or attribute that qualifies the property for Section 4(f) protection; and

(2) The official(s) with jurisdiction over the Section 4(f) resource agree in writing to paragraph (g)(1) of this section.

If you agree that the construction within Columbus Park satisfies the exception that the "*The use of the Section 4(f) property is solely for the purpose of preserving or enhancing an activity, feature, or attribute that qualifies the property for Section 4(f) protection",* please indicate your concurrence by signing the last page of this letter and returning it to the Department in the enclosed self-addressed envelope. We request a response by June 7, 2017, if possible.

If you have any questions or need additional information, please contact Mark Peterson, Project Manager, at (847) 705-4569.

Very truly yours,

Anthony J. Quigley, P.E.
Region One Engineer

NOISE BARRIER VISUALIZATIONS

IDOT recognizes that noise barriers would be a new built element in the Project Corridor, and considers them a potential opportunity to provide visual enhancement to both the mainline and adjacent land uses. As such, IDOT is open to the innovative use of both traditional and new materials for noise barrier construction and will work with local communities to select the most appropriate material(s), character, and finishes for barriers with the local context. To achieve the ultimate desired character and aesthetic requested by the stakeholders, local financial participation may be required.

The following illustrations are representative of the possible appearance of the proposed noise walls at various locations within the Project Corridor. The ultimate appearance of noise barriers will be determined during the final design phase of the project.

ADDRESSES: The FAA will accept written comments on the DEA until close of business on March 31, 2010. Comments on the DEA may be sent to: Ms. Virginia Marcks, FAA, AJW–C14D, 2300 East Devon Ave., Des Plaines, IL 60018, fax 847–294–7698, e-mail *virginia.marcks@faa.gov.* Copies of the Draft EA on compact disk may be obtained by contacting Ms. Virginia Marcks. Comments received on the DEA during the public comment period will be addressed in a Final Environmental Assessment.

FOR FURTHER INFORMATION CONTACT: Ms. Virginia Marcks, Manager, Infrastructure Engineering Center, Federal Aviation Administration, 2300 East Devon Avenue, Des Plaines, Illinois 60018. *Telephone number:* 847–294–7494. *E-mail: virginia.marcks@faa.gov.*

Issued in Des Plaines, Illinois, February 19, 2010.

Virginia Marcks,

Manager, Infrastructure Engineering Center, Chicago, AJW–C14D,

Central Service Area.

[FR Doc. 2010–3936 Filed 2–25–10; 8:45 am]

BILLING CODE 4910–13–P

DEPARTMENT OF TRANSPORTATION

Federal Highway Administration

Environmental Impact Statement: Cook County, IL

AGENCY: Federal Highway Administration (FHWA), DOT.

ACTION: Notice of Intent.

SUMMARY: The FHWA is issuing this notice to advise the public that an environmental impact statement will be prepared for a proposed transportation project in Cook County, Illinois.

FOR FURTHER INFORMATION CONTACT: Norman R. Stoner, P.E., Division Administrator, Federal Highway Administration, 3250 Executive Park Drive, Springfield, Illinois 62703, *Phone:* (217) 492–4600. Diane O'Keefe, P.E., Deputy Director of Highways, Region One Engineer, District 1, Illinois Department of Transportation, 201 W. Center Court, Schaumburg, IL 60196–1096, *Phone:* (847) 705–4110.

SUPPLEMENTARY INFORMATION: The FHWA, in cooperation with the Illinois Department of Transportation, will prepare an environmental impact statement (EIS) on a proposal to improve Interstate 290 (I–290) located in the Illinois county of Cook. The proposed improvement would involve the reconstruction of the existing 7.5 mile roadway facility from US 12/20/45 (Mannheim Road) to east of IL 50 (Cicero Avenue). Improvements to the corridor are considered necessary due to safety concerns, operational issues, traffic congestion, and age of facility. Alternatives that may be considered include (1) taking no action; (2) a full range of multi-modal build alternatives that involve the reconstruction of I–290.

Improvements to I–290 have the potential to affect environmental features in the project area. The corridor is located in a highly developed mature urban setting with limited biological and natural resources. The built environment has the potential to be affected. Some resources within the proposed area include: cemeteries, parks, special waste sites, nearby historic districts, possible residential and commercial displacements, air quality, sensitive noise receptors, the Des Plaines River, and related indirect and cumulative impact considerations.

Letters describing the proposed action and soliciting comments will be sent to appropriate Federal, State, and local agencies. As part of the EIS process a scoping meeting for obtaining input from Resource Agencies was held on September 9, 2009.

The Illinois Department of Transportation's Context Sensitive Solutions (CSS) process will be used for public involvement. A Stakeholder Involvement Plan (SIP) has been developed to ensure that the full range of issues related to this proposed project are identified and addressed. The SIP provides meaningful opportunities for all stakeholders to participate in defining transportation issues and solutions for the study area. One public meeting will be held in Cook County at each project milestone. In addition to the public meetings, a public hearing and comment period will be held following the release of the Draft EIS. Public notice will be given for the time and place of the public meetings and hearing. A project website has been established (*http://www.eisenhowerexpressway.com*) as one element of the project public involvement process.

To ensure that the full range of issues related to this proposed action are addressed and all significant issues identified, comments and suggestions are invited from all interested parties. Comments or questions concerning this proposed action and the EIS should be directed to the FHWA at the address provided above.

(Catalog of Federal Domestic Assistance Program Number 20.205, Highway Planning and Construction. The regulations implementing Executive Order 12372 regarding intergovernmental consultation on Federal programs and activities apply to this program.)

Issued on: February 17, 2010.

Norman R. Stoner,

Division Administrator, Springfield, Illinois.

BILLING CODE 4910–22–M

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

Notice of Availability of a Final Environmental Assessment (Final EA) and a Finding of No Significant Impact (FONSI)/Record of Decision (ROD) for the New Airport Traffic Control Tower and Base Building at Cherry Capital Airport, Traverse City, MI

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Notice of Availability of a Final Environmental Assessment (Final EA) and a Finding of No Significant Impact (FONSI)/Record of Decision (ROD) for the New Airport Traffic Control Tower and Base Building at Cherry Capital Airport, Traverse City, Michigan.

SUMMARY: The Federal Aviation Administration (FAA) is issuing this notice to advise the public that the FAA has prepared, and approved on February 8, 2010, a Finding of No Significant Impact (FONSI)/Record of Decision (ROD) based on the Final Environmental Assessment (Final EA) for a New Airport Traffic Control Tower (ATCT) and Base Building at Cherry Capital Airport (TVC) in Traverse City, Michigan. The FAA prepared the Final EA in accordance with the National Environmental Policy Act and the FAA's regulations and guidelines for environmental documents. It was accepted on November 2, 2009 by the FAA's Responsible Federal Official.

FOR FURTHER INFORMATION CONTACT: Ms. Virginia Marcks, Manager, Infrastructure Engineering Center, AJW–C14D, Federal Aviation Administration, 2300 East Devon Avenue, Des Plaines, Illinois 60018. *Telephone number:* (847) 294–7494.

SUPPLEMENTARY INFORMATION: The Final EA evaluated the construction and operation of a new ATCT at TVC. The replacement ATCT will be a Low Activity Level facility with a 395 square foot cab accommodating two operational positions and two support positions. The ATCT will be constructed on 1.64 acres of land owned by the airport, 520 feet northeast of the existing ATCT and will have a cab floor height of 752 feet above mean sea level, located within the footprint of Airport Access Road. The

should refer to File Number SR–Phlx–2013–23, and should be submitted on or before April 26, 2013.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.[28]

Kevin M. O'Neill,

Deputy Secretary.

[FR Doc. 2013–07939 Filed 4–4–13; 8:45 am]

BILLING CODE 8011–01–P

DEPARTMENT OF TRANSPORTATION

Federal Highway Administration

Environmental Impact Statement: Cook County, Illinois

AGENCY: Federal Highway Administration (FHWA), DOT.

ACTION: Revised Notice of Intent.

SUMMARY: The FHWA is issuing this revised notice of intent to advise the public that an environmental impact statement is being prepared for the proposed I–290 highway improvement project in Cook County, Illinois, and that the project limits in the Notice of Intent (NOI) published in the **Federal Register** on February 26, 2010 have been expanded.

FOR FURTHER INFORMATION CONTACT: Mr. J. Michael Bowen, P.E., Acting Division Administrator, Federal Highway Administration, 3250 Executive Park Drive, Springfield, Illinois 62703, Phone: (217) 492–4600. John Fortmann, P.E., Acting Deputy Director of Highways, Acting Region One Engineer, District 1, Illinois Department of Transportation, 201 W. Center Court, Schaumburg, IL. 60196–1096, Phone: (847) 705–4110.

SUPPLEMENTARY INFORMATION: The FHWA, in cooperation with the Illinois Department of Transportation, is preparing an environmental impact statement (EIS) on a proposal to improve Interstate 290 (I–290) located in Cook County, Illinois. Based on public input and studies conducted to date, FHWA and IDOT now will include an additional section of I–290 from east of IL 50 (Cicero Avenue) to Racine Avenue in the EIS so that the limits of the proposed improvements are from west of Mannheim Road to Racine Avenue, a total distance of 13.0 miles. The additional section between east of Cicero Avenue and Racine Avenue may include operational improvements consisting of the potential conversion of two or more lanes of the eight lane expressway to accommodate managed lanes or various tolling strategies.

Improvements to the corridor are considered necessary due to safety concerns, operational issues, traffic congestion, and age of facility. Alternatives under consideration include (1) taking no action; (2) a full range of multi-modal build alternatives that involve reconstruction of all, or portions of, I–290 and the rehabilitation of the remainder to include operational changes.

Improvements to I–290 have the potential to affect environmental features in the project area depending on the alternative selected. The corridor is located in a highly developed mature urban setting with limited biological and natural resources. The built environment has the potential to be effected. Some features include: cemeteries, parks, special waste sites, nearby historic districts, possible residential and commercial displacements, sensitive noise receptors, a crossing of the Des Plaines River, and related indirect and cumulative impact considerations.

Letters have been sent to appropriate Federal, State, and local agencies reflecting the revised project limits, describing the proposed action, and soliciting comments. Input from Resource Agencies will continue to be obtained through the established stakeholder involvement methods including the Corridor Advisory Group (CAG) and NEPA/404 Merger process.

The Illinois Department of Transportation's Context Sensitive Solutions (CSS) process will continue to be used for public involvement. The existing Stakeholder Involvement Plan (SIP) will be updated to ensure that the full range of issues related to the change in project limits are identified and addressed. The SIP will continue to provide meaningful opportunities for all stakeholders to participate in defining transportation issues and solutions for the study area. The Corridor Advisory Group will continue as a primary method of stakeholder interaction. In addition, a public hearing and comment period will be held following the release of the Draft EIS. Public notice will be given for the time and place of the public hearing. A project Web site has been established (*www.eisenhowerexpressway.com)* as one element of the project public involvement process.

To ensure that the full range of issues related to this proposed action are addressed and all significant issues identified, comments and suggestions are invited from all interested parties. Comments or questions concerning this proposed action and the EIS should be directed to the FHWA at the address provided above.

(Catalog of Federal Domestic Assistance Program Number 20.205, Highway Planning and Construction. The regulations implementing Executive Order 12372 regarding intergovernmental consultation on Federal programs and activities apply to this program.)

Issued On: April 1, 2013.

J. Michael Bowen,

Acting Division Administrator, Springfield, Illinois.

BILLING CODE 4910–22–P

DEPARTMENT OF TRANSPORTATION

Surface Transportation Board

[Docket No. AB 33 (Sub-No. 302X)]

Union Pacific Railroad Company—Abandonment Exemption—in Dunn County, WI.

Union Pacific Railroad Company (UP) filed a verified notice of exemption under 49 CFR part 1152 subpart F–*Exempt Abandonments* to abandon a 0.58-mile line of railroad on its Menomonie Industrial Lead from milepost 0.32 near Cedar Falls Road to the end of the line at milepost 0.90 near Oak Avenue, in Menomonie, Dunn County, Wis. (the Line). The Line traverses United States Postal Service Zip Code 54751.

UP has certified that: (1) No local traffic has moved over the Line for at least two years; (2) there is no overhead traffic on the Line; (3) no formal complaint filed by a user of rail service on the Line (or by a state or local government entity acting on behalf of such user) regarding cessation of service over the Line either is pending with the Surface Transportation Board (Board) or with any U.S. District Court or has been decided in favor of complainant within the two-year period; and (4) the requirements at 49 CFR 1105.7(c) (environmental report), 49 CFR 1105.11 (transmittal letter), 49 CFR 1105.12 (newspaper publication), and 49 CFR 1152.50(d)(1) (notice to governmental agencies) have been met.

As a condition to this exemption, any employee adversely affected by the abandonment shall be protected under *Oregon Short Line Railroad—Abandonment Portion Goshen Branch Between Firth & Ammon, in Bingham & Bonneville Counties, Idaho,* 360 I.C.C. 91 (1979). To address whether this condition adequately protects affected employees, a petition for partial revocation under 49 U.S.C. 10502(d) must be filed.

[28] 17 CFR 200.30–3(a)(12).

Illinois Department of Transportation

Eisenhower expressway

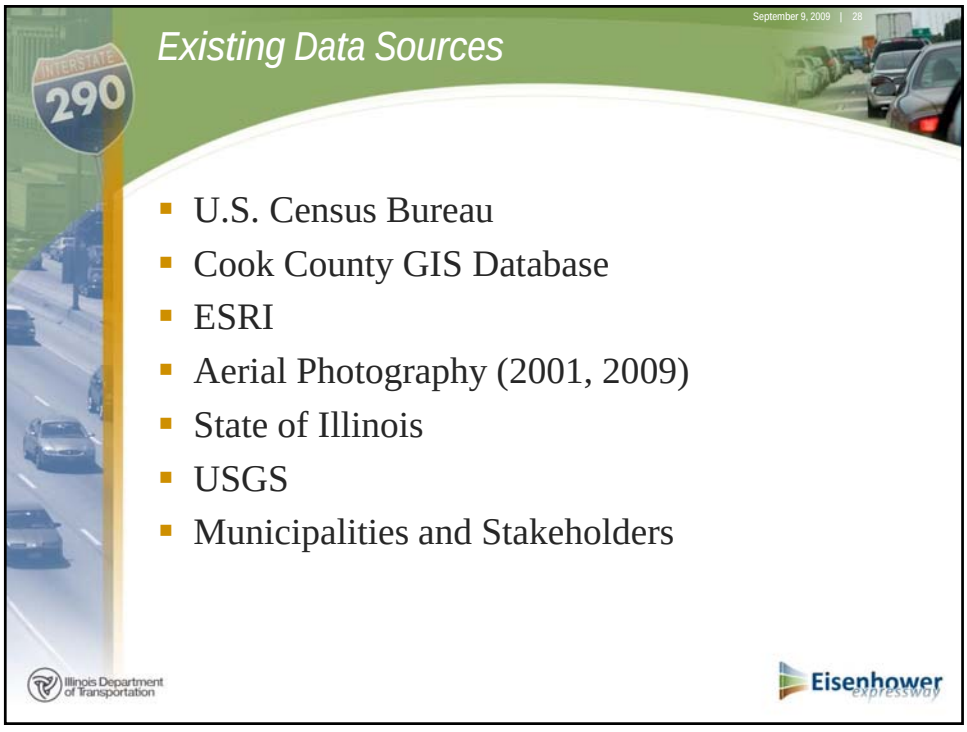
Next Steps

- Existing conditions, analyses' and deficiencies
- Environmental data collection
- Problem Definition
- Purpose and Need



Illinois Department of Transportation

Eisenhower expressway

Environmental Data

Existing Data Sources

- U.S. Census Bureau
- Cook County GIS Database
- ESRI
- Aerial Photography (2001, 2009)
- State of Illinois
- USGS
- Municipalities and Stakeholders

Environmental Data Collection

- Environmental Survey Requests (ESR)
  - ESR original submittal 2001
  - T&E clearance on Indiana Bats (2008-2012)
  - ESR addendum/update 2009
- Field observations and surveys
- Stakeholder data and plans

Environmental Features

- Cultural
- Cemeteries
- Air Quality
- Noise
- Water Resources
- Special Waste

Cultural Resources

- ESR process will determine if any archaeological sites
- No historic bridges
- Historic Districts
- Known 4(f) properties
  - Station Park
  - Barrie Park
  - Rehm Park
  - Two Tot Lot Parks
  - Veterans Park
  - Columbus Park

Cemeteries

- Concordia – located on the north side of I-290 east of the Des Plaines River.
- Forest Home – located on the south side of I-290 between 1st Avenue and the Des Plaines River.
- Waldheim – located east of the Des Plaines River on the south side of I-290.

Air Quality and Noise Impacts

- Non-Attainment area $PM_{2.5}$
- 8-hour Ozone – Moderate
- Project included in 2030 Regional Transportation Plan
- Microscale (CO) air quality analysis will be performed
- Noise impacts will be studied

Water Resources

- Des Plaines River
- Addison Creek
- There is no impact to groundwater resources. All communities in the project area utilize Lake Michigan water.
- Des Plaines River is a regulatory floodway
- NWI maps show wetland area associated with Des Plaines River

Special Waste

- Preliminary Environmental Site Assessment (PESA) by Illinois State Geological Survey (ISGS)
  February 14, 2003
- Volatile organic and metals testing identified contamination-74 possible sites
- PESA identified project as high risk
- ESR Addendum to update special waste assessment

Scoping Discussion

Questions?

Illinois NEPA/404 Merger Meeting

September 9, 2009

I-290 (Eisenhower Expressway)
US 12/20/45 (Mannheim Road) to Illinois Route 50 (Cicero Avenue)
Job No. P-91-201-00
Cook County

This was the first presentation of the I-290 project to the Illinois NEPA/404 Merger Team. The meeting was held at 2:00 pm on September 9th, 2009 at the FHWA Illinois Division Office in Springfield Illinois. The purpose of the meeting was to introduce the I-290 project to the merger team and conduct scoping with the agencies.

IDOT District 1 and the project consultant presented a PowerPoint presentation to the Merger Team and FHWA. The presentation provided a history of the project corridor (from 1940's to present) and described the relevant prior and current studies by IDOT & other agencies. The presentation explained the progression of the I-290 Phase I study from an ECAD in 2001 to its present designation of EIS, the adoption of IDOT's Context Sensitive Solutions (CSS) process, and the goal of reaching a Record of Decision and Design Approval of a preferred alternative.

Following the history and study overview, the Merger Team was lead through a discussion of environmental data sources, collection, and was presented the known environmental features on 11x17 color corridor maps.

The presentation was followed by an open forum question and answer scoping discussion. The following lists the items discussed:

- There are no proposed uses for the Hillside Landfill related to the project
- The CTA and Railroads are key stakeholders and close study partners. The CTA station at Forest Park is highly constrained and CTA was looking into expanding and updating this facility. Currently CTA improvements in this corridor are on hold pending the I-290 study.
- The Commonwealth Edison site is still in use, However Maywood is interested in redeveloping this site. ComEd site would be most suitable for redevelopment as a TOD center.
- EPA asked that the study expand the PM 2.5 analysis and include more detailed emissions analysis of mobile source air toxics (MSATs) especially in environmental justice areas
- Use of the CSX freight rail line along the study corridor will drop significantly with the Canadian National's purchase of the EJ&E where the majority of CN's operations will now be routed. Preliminary discussions were held with the railroads but no commitments have been made yet. The study team will continue to coordinate with the railroads.
- Between RTA's Cook DuPage Corridor Study and Oak Park, several dozen alternatives have been put forward, including Bus Rapid Transit (BRT), High Occupancy Vehicle lane (HOV), a Blue Line Extension, and others.
- The Blue Line extension is loosely defined as extending as far west as Oak Brook, however no alignment(s) have been located.

- The EPA said that removal/consolidation of the closely spaced ramps between 25th avenue and DesPlaines Avenue should be considered. IDOT will be analyzing the safety of these ramps. Elimination of any access point will involve a great deal of public involvement
- This study is currently continuing under the assumption that the four lane section east of Cicero Avenue is still functionally adequate. The eastern limit is currently where an old construction segment ends just west of Kostner Avenue.
- The frontage roads are included as part of the environmental analysis
- The highway, pavement and structures are approximately 50 years old and are near the end of their useful life which will require a complete rebuild; depending on the study outcome this could be a replacement in-kind or variation.
- There are sensitive noise receptors in the study corridor and noise barriers will be considered. The CSS process will be used to help determine any noise wall locations within the communities on a case-by-case basis.
- There is at least one historic district within the study area. Further data collection and public involvement will be used to confirm the number and location of any historic districts or resources.

The meeting concluded with a discussion of whether or not this study should, or needs to, follow the formal NEPA/404 merger/concurrence process. The reasoning for not establishing a formal NEPA/404 merger team process is:

- The project was reclassified as an EIS to accommodate public concerns – project was initially an ECAD.
- A formal 404 schedule/process requires prescribed milestone and long-lead submittal dates that may add time to the project schedule
- NEPA/404 coordination in lieu of concurrence allows the study to be more nimble

IDOT recommended proceeding with the study as an 'EIS with agency review', using the scheduled NEPA/404 Merger Team meetings as a forum for project study updates. The EPA agreed that this would be a good forum and the periodic updates would keep the project moving. The EPA added that it appeared that permits would not be likely, however the USACE (not present) would need to review.

IDOT explained that the first potential concurrence point, purpose and need, is planned for June 2010, therefore allowing the agencies some time to consider this approach.

IDOT – John Baczek, Mark Peterson, Pete Harmet (By telephone)
Consultant Team – Ed Leonard, Tim Selover, Bryan Kapala

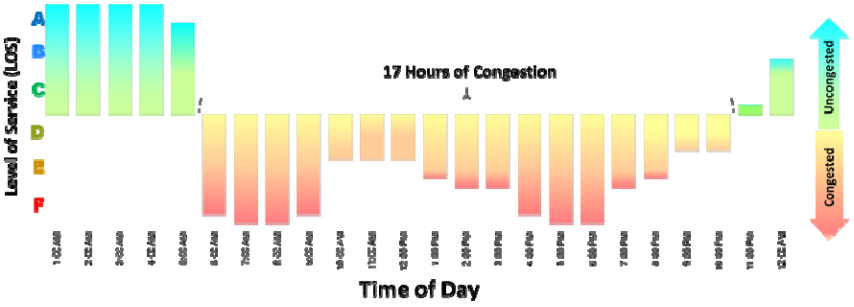
I-290 Draft Purpose and Need



Purpose & Need

- **PURPOSE:** *to provide an improved transportation facility along the I-290 Eisenhower expressway multimodal corridor*
- **NEEDS:** Five specific need points to be addressed:
  - *Improve regional and local travel*
  - *Improve access to employment*
  - *Improve safety for all users*
  - *Improve modal connections and opportunities*
  - *Improve facility deficiencies*
- Purpose and Need is available for review at www.eisenhowerexpressway.com

Need Point #1: Improve Regional and Local Travel

Improve Regional Travel

- Congestion along I-290 corridor reduces its ability to serve regional travel
  - Existing mainline traffic exceeds the ideal highway capacity by 136%
  - I-290 experiences up to 17 hours of congestions a day

Need Point #1: Improve Regional and Local Travel

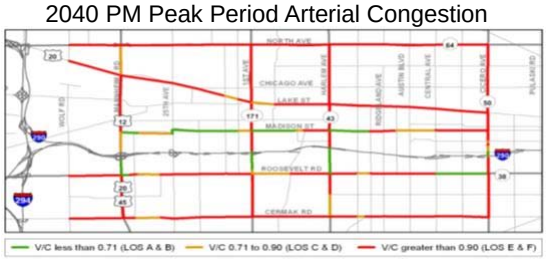
Illinois Department of Transportation

Improve Local Travel

- Local travel in the study area is negatively affected by congestion at the interchanges and along the arterial streets
  - 7 out of 10 interchanges have movements that are failing (LOS F)
  - 68% of the study area arterials operate at very congested conditions

I-290 Interchanges with Failing Movements

Eisenhower expressway



Need Point #1: Improve Regional and Local Travel

Illinois Department of Transportation

2010 PM Peak Period Arterial Congestion

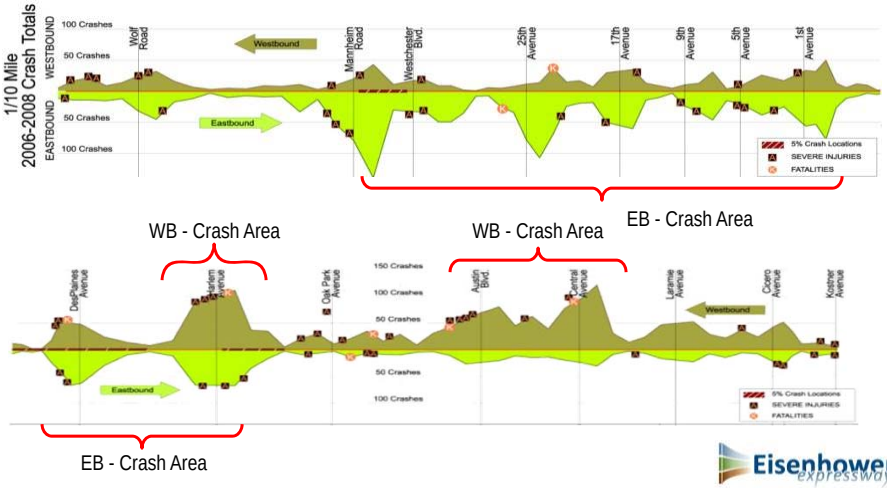
2040 PM Peak Period Arterial Congestion

Eisenhower expressway

Need Point #2: Improve Safety For All Users

Illinois Department of Transportation

- Address High Comparative Crash Rates on I-290
  - Crash rates on I-290 as much as 61% higher than similar highways in the region



Eisenhower expressway

Need Point #2: Improve Safety For All Users

Illinois Department of Transportation

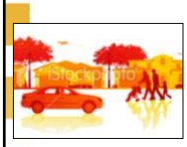
- Addresses high frequency crashes
  - 71 % of all crashes are rear-end

Eisenhower expressway

Need Point #2: Improve Safety For All Users

Illinois Department of Transportation

- Address Pedestrian-Vehicle Conflicts on Cross-Streets
  - 16 reported pedestrian crashes on I-290 cross street (2006-2008)



Eisenhower expressway

Need Point #3: Improve Access To Employment

Illinois Department of Transportation

Traditional Commute

61% LOS F

Morning Eastbound I-290

71% LOS F

Evening Westbound I-290

Western Suburbs

20% of the Traditional commute is served by the existing transit system (higher than the Chicago region average 10%)

Chicago CBD

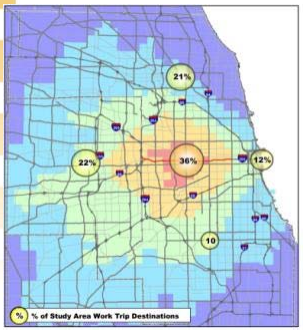
Reverse Commute

80% LOS F

Morning Westbound I-290

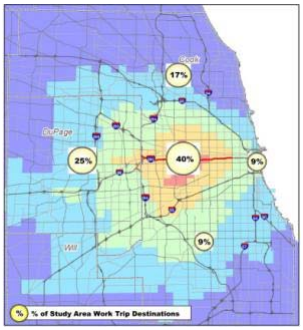
65% LOS F

Evening Eastbound I-290



Transit options are limited for reverse commute travelers

Eisenhower expressway



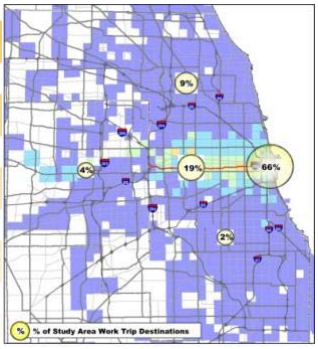
Need Point #3: Improve Access To Employment

- Heavy congestion on I-290 and the arterials in the study area constrains connectivity between workers and jobs.
  - Accessibility to Jobs from the study area by auto will decrease up to 33% by 2040 (No Build Scenario)

2010 AM Peak Period Auto Travel Time Contours

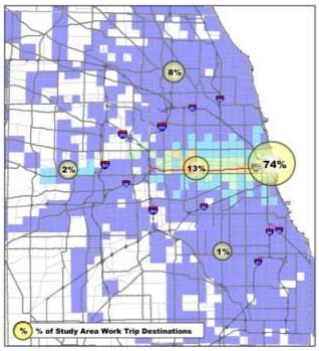
2040 AM Peak Period Auto Travel Time Contours

Up to 15 Minutes | 15 to 30 Minutes | 30-45 Minutes | 45-60 Minutes | More than 60 minutes



Number of Jobs Accessible by Auto			
Travel Time (minutes)	2010	2040 Baseline	Change
Up to 15	107,000	79,000	-26%
15 – 30	449,000	302,000	-33%
30 – 45	1,601,000	1,391,000	-13%
45 – 60	1,760,000	1,613,000	-8%

Eisenhower expressway



Need Point #3: Improve Access To Employment

- Many transit trips traveling via rail transit
  - Accessibility to Jobs from the study area by transit will see very little change by 2040

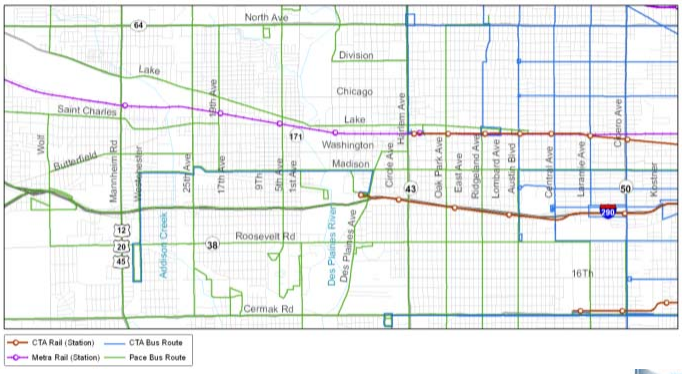
2010 AM Peak Period Transit Travel Time Contours

2040 AM Peak Period Transit Travel Time Contours

Up to 15 Minutes | 15 to 30 Minutes | 30-45 Minutes | 45-60 Minutes | More than 60 minutes | Not Accessible by Transit

Number of Jobs Accessible by Transit			
Travel Time (minutes)	2010	2040 Baseline	Change
Up to 15	4,000	4,000	0%
15 – 30	57,000	57,000	0%
30 – 45	796,000	786,000	-1%
45 – 60	477,000	534,000	12% *

** Provide explanation for increase*



Eisenhower expressway

Need Point #4: Improve Modal Connections and Opportunities

Illinois Department of Transportation

- The study area has a well developed and utilized transportation system that carries 21% of the home-to-work travel in the study area

Study Area Transit Network

Eisenhower expressway

Need Point #4: Improve Modal Connections and Opportunities

Illinois Department of Transportation

- Improve Pedestrian Access to Transit
  - 67% of CTA station boardings in the study areas involve pedestrian trips
  - Pedestrian conflicts with vehicles at stations located on congested cross-streets

- Improve Bicycle Access to Transit
  - Bicycle access difficult due to lack of bike lanes or inadequate shoulders
  - Lack of adequate bicycle parking

- Improve Vehicular Access to Transit
  - Limited and constrained existing park and ride facilities in study area
  - Access to CTA park and ride facility is constricted by congested traffic on DesPlaines Avenue and I-290 Ramps

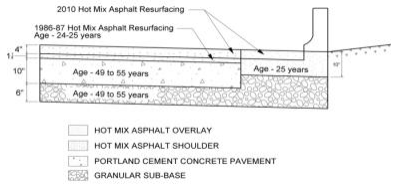
Eisenhower expressway

Need Point #4: Improve Modal Connections and Opportunities

Illinois Department of Transportation

- Improve Bus Transfer Connections
  - 33% of station entries are transfers from CTA and Pace buses
  - Four of the five study area stations are location on busy I-290 overpasses, with no dedicated bus pull outs
  - CTA station access on single side of street requires bus transfers from opposite side to cross busy street

- Improve Non-Motorized Connections
  - Only two crossings of I-290 are for pedestrian and bicycle only
  - Five crossings are not recommended by IDOT for bicycle travel
  - 14 remaining crossings do not have adequate shoulders or bicycle lanes

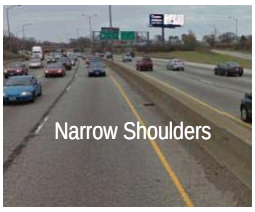


Eisenhower expressway

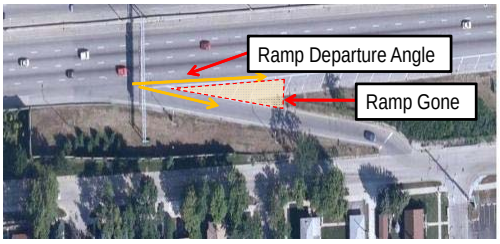
Need Point #5: Improve Facility Deficiencies

Illinois Department of Transportation

- Address Pavement Age
  - Existing pavement was installed in the 1950s as part of original construction
  - Existing sub-base is over 50 years old, exceeding typical service life by 30 years



- Address Structure Deficiencies
  - All bridges structurally adequate and essential for public use
  - 12 of 26 bridges are 'functionally obsolete' in that they have design and geometrics that are considered unacceptable for current traffic conditions and uses



Eisenhower expressway

Need Point 5: Improve Facility Deficiencies

- Address geometric deficiencies
  - Much of the existing design does not meet modern design standards
  - 80% of mainline shoulders are too narrow
  - Most of the existing crossroad profiles and grades are sub-standard
  - On-third of the ramp departure angles are too abrupt
  - 80% of the exit ramp recovery areas (gore areas) are too short

Eisenhower expressway

Need Point 5: Improve Facility Deficiencies

- Address ADA Ramp & Sidewalk Deficiencies
  - 30% of cross road intersections do not have ADA compliant ramps
  - 10 of the 21 crossings of I-290 do not ADA standards
  - Sidewalks at CTA stations are narrower than the recommended 8 – 10 foot widths and have obstructions

- Address Drainage Deficiencies
  - Existing inlet spacing is too far apart for 50 year storm
  - Trunk sewer system inadequate to handle 100 year storm
  - Existing bridges over Addison Creek and Des Plaines River are too low

Eisenhower expressway

Initial Stakeholder Single-Mode Alternatives

Alternatives Development & Evaluation

Illinois Department of Transportation

- Alternatives suggested by CAG and at Public Meeting #1
- Over 170 suggestions including:

DRAFT
NEPA/404 Merger Meeting Summary
June 28, 2011

IDOT District 1, Cook County
Interstate 290 (I-290)
Environmental Impact Statement
Information - Purpose and Need

This was the second presentation of the I-290 project. The previous presentation was on September 9, 2009. The purpose of the meeting was to update the Merger Team on the status of the I-290 Project and present the draft Purpose and Need for information only.

The IDOT District One and project consultant, Parsons Brinckerhoff (PB), made a PowerPoint presentation to the Merger Team. The presentation consisted of a project overview, a study process update, an introduction to the Draft Purpose and Need statement, a synopsis of the Public Meeting comments, and the next steps for the Project.

PROJECT OVERVIEW

Interstate 290 (I-290) Eisenhower Expressway provides the primary east-west roadway access between Chicago and the western suburbs and also serves other transportation markets. The study area extends along I-290 in Cook County from west of Mannheim Road, to east of Cicero Avenue. Extending for approximately 9 miles, the study area passes through eight communities including Hillside, Westchester, Broadview, Bellwood, Maywood, Forest Park, Oak Park, and Chicago. The I-290 Corridor was originally constructed and opened to traffic in the 1950's, and was the first new multi-modal transportation corridor in the United States. Now, at over 50 years of age, I-290 has exceeded its life expectancy and is in need of reconstruction.

STUDY PROCESS UPDATE

The I-290 Study has been categorized as an Environmental Impact Statement (EIS), and is following IDOT's Context Sensitive Solutions (CSS) public involvement process. The Project Study Group (PSG) and the Corridor Advisory Group/Task Force (CAG/TF) have committed significant time and effort to the study process and progress of the project. Using stakeholder input, combined with detailed technical studies, the PSG has; identified goals and objectives for the study, developed the project problem statement, identified existing environmental constraints, identified the existing transportation system deficiencies, developed the draft purpose and need statement, and identified an initial range of suggested single-mode alternatives. Through the CSS process, the PSG has held many stakeholder events including two public meetings and nine CAG/TF meetings.

PURPOSE AND NEED INTRODUCTION

The project purpose is to provide an improved transportation facility along the I-290 Eisenhower Expressway multimodal corridor. The Five specific needs to be addressed are: improve regional and local travel, improve access to employment, improve safety for all users, improve modal connections and opportunities, and improve facility deficiencies. The Draft Purpose and Need statement is available on the project website where it has been posted since April 2011. Individual need points were presented as follows:

- **Need Point #1: Improve Regional and Local Travel:** Severe congestion along the I-290 corridor reduces its ability to serve regional travel. The existing mainline exceeds the calculated ideal highway capacity by 136% in the six lane section between Mannheim Road and Cicero Avenue, and I-290 experiences up to 17 hours of congestion (LOS D or worse) each day in both the eastbound and westbound directions. Improve Local Travel addresses the congested conditions on parallel and crossing arterials within the study area caused by diversion of traffic from I-290 and failing or constrained movements at I-290 interchanges. Seven out of ten study area interchanges have failing movements.

- **Need Point #2: Improve Access to Employment:** Heavy congestion on I-290 and the arterials in the study area constrains connectivity between workers and jobs. Both the Traditional commute and the Reverse commute experience Level of Service F on I-290 during the am and pm peak periods. Congestion on I-290 and parallel routes negatively affects bus travel times, ability to make modal connections and access to transit by automobile. Accessibility to regional jobs by automobile is expected to decline by up to 33% and remain unchanged or increase slightly for transit accessibility to jobs by 2040.

- **Need Point #3: Improve Safety for all Users:** Improve safety for all users addresses the high comparative crash rates on I-290 which are 61% higher than similar expressways in the region. Rear end crashes were the highest crash frequency type comprising 71% of the total 6066 crashes recorded in the 3 year period from 2006 to 2008. The peak crash areas were eastbound from Mannheim Road to 1st Avenue, both directions between Des Plaines Avenue and Harlem Avenue, and westbound from Central Avenue to Austin Avenue. The main contributors to these crash hot spots are attributed to congestion, lane reductions, left hand ramps, narrow shoulders, and weaving. Type K and A injury crashes primarily occurred during off-peak hours when expressway travel speeds were higher. The Purpose and Need will also address the pedestrian-vehicle conflicts on cross streets.

- **Need Point #4: Improve Modal Connections and Opportunities:** The study area has a well developed transportation system that carries 21% of the home-to-work travel. Although this utilization rate is higher than transit usage for the Chicago Region overall, there are many deficiencies that prevent optimum usage of study area transit services. The specific areas of focus include: improve bicycle and pedestrian access to transit, improve vehicular access to transit, improve bus transfer connections, and improve non-motorized connections.

- **Need Point #5: Improve Facility Deficiencies:** The original concrete pavement base and granular subbase are over 50 years old, exceeding their typical service life by approximately 30 years. This need point will address pavement age, address structure deficiencies, address geometric deficiencies, address ADA Ramp and Sidewalk deficiencies, and address drainage deficiencies related to drainage system capacity and condition.

SYNOPSIS OF PUBLIC MEETING #2 COMMENTS

The purpose of Public Meeting #2 was to solicit public input on the Draft Purpose and Need statement and the initial range of single mode alternatives for public comment. The public meeting format received a number of positive comments on how well the material was presented.

The majority of the comments received on the Draft Purpose and Need can be summarized in five distinct areas. These five areas are: include environmental criteria (such as climate change, air quality, water quality, public health, fossil fuel consumption, etc), include discussion of alternatives, include addressing CTA/Pace/Metra facility deficiencies, include addressing freight traffic needs in the corridor, and extend the study area. These comments will be included in the public record. The PSG is preparing comment responses, and considering changes to the Draft Purpose and Need that may be necessary based on the public input.

The initial range of single mode alternatives were developed from a list of 170 alternatives suggested through the public involvement process including a CAG/TF workshop, public meeting #1 and through website comments. The 170 alternatives include transit, highway, bicycle and pedestrian, as well as traffic management systems and strategies. Alternatives comments received at Public Meeting #2 were largely endorsements of previously identified alternatives or suggested enhancements to displayed alternatives.

NEXT STEPS

The next steps are to finalize the Draft Purpose and Need statement and to request formal NEPA/404 Merger Team concurrence on the document.

The PSG is currently working to refine and evaluate alternatives. Round 1 of the alternatives evaluation will test single-mode alternatives based on travel benefit and how well they meet the project Purpose and Need. Round 2 will evaluate combination alternatives, and Round 3 will provide detailed evaluation of Draft Environmental Impact Statement (DEIS) alternatives.

PROJECT DISCUSSIONS

USEPA (West) requested clarification on the Single Mode Travel Benefit Analysis. IDOT (Harmet) responded that we will initially model the single mode alternatives to see how they perform individually. An example of a single mode would be a Blue Line extension or a High Occupancy Vehicle (HOV) lane. These single mode alternatives will not address all of the needs of the corridor, but when combined with another single mode alternative, a greater number of needs will be satisfied.

USACE (Chernich) asked whether this project will receive official concurrence given that an Individual Permit will not likely be needed. IDOT (Harmet) answered that this is not an official concurrence project because we do not know the extent of the alternatives, and whether an Individual Permit will be needed. However, IDOT plans to go through with NEPA coordination because of the public interest and because it is too early to make concrete decisions about concurrence. USEPA (Westlake) suggested that the project should continue to seek concurrence due to the level of public interest and the potential for future environmental considerations such as air, noise or environmental justice should they arise.

NEPA/404 Merger Team Meeting

January 13, 2012

Illinois Department of Transportation

Eisenhower expressway

Agenda

Illinois Department of Transportation

- Study Background
- Existing Transportation System Performance Report
- Purpose and Need Overview
- Purpose and Need Comments Summary
- Single Mode Alternatives Identification & Evaluation Overview
- Next Steps – Combination Modes

Eisenhower expressway

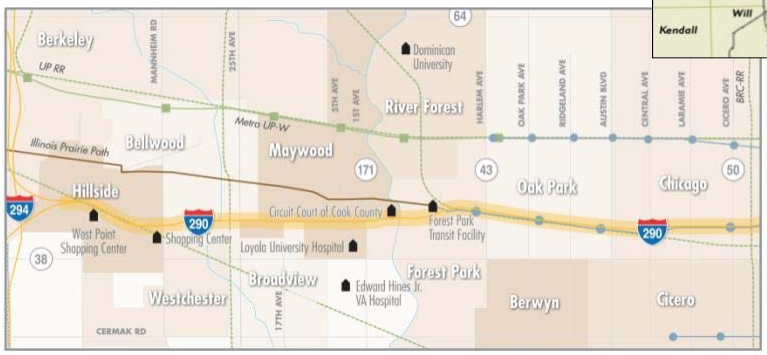
Study Background

Illinois Department of Transportation

Why is I-290 Being Studied?

Illinois Department of Transportation

- I-290 corridor was built during the 1950s
- First multi-modal transportation corridor in US
- Major link in the regional transportation network
- Section between Mannheim Road and Cicero Avenue is over 50 years old and in need of reconstruction



4

Eisenhower expressway

I-290 Study Area

- West of Mannheim Road to East of Cicero Avenue
- Approximately 9 miles
- Eight Communities

Study Status

Stakeholder Involvement to Date

- 12 Corridor Advisory Group/Task Force (CAG/TF) Meetings
- Public Meeting #1 – November 2009
- Public Meeting #2 – May 2011
- Individual Community Stakeholder meetings
- Agency and Transit Working Group meetings

Resource Agency Meetings

- NEPA/404 Merger Team Meeting – September 2009
  - Agency scoping
- U.S. EPA Briefing – May 2011
- NEPA/404 Merger Team Meeting – June 2011
  - Purpose and Need briefing

Existing Transportation System Performance Report

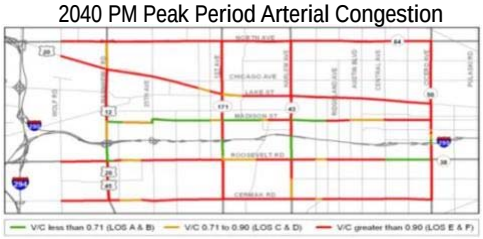
Illinois Department of Transportation

- Describes existing transportation conditions
  - Study area transportation system (roadways, public transportation, freight railroads, non-motorized transportation)
  - Socio-economic and land use
  - Identifies deficiencies
- Available on project website
  - http://www.eisenhowerexpressway.com/info_center/reports.aspx

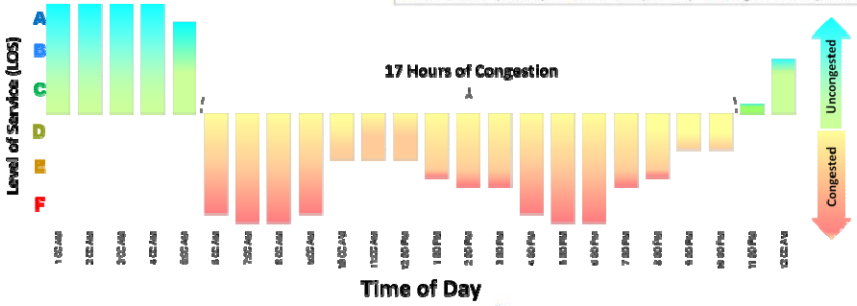
I-290 Purpose and Need Statement

Illinois Department of Transportation

- PURPOSE: To provide an improved transportation facility along the I-290 Eisenhower Expressway multimodal corridor
- NEEDS: Five specific need points to be addressed:
  - Improve regional and local travel
  - Improve access to employment
  - Improve safety for all users
  - Improve modal connections and opportunities
  - Improve facility deficiencies



Need Point #1: Improve Regional and Local Travel



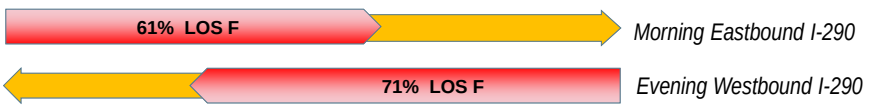
Illinois Department of Transportation

- Improve regional travel
- Improve local travel

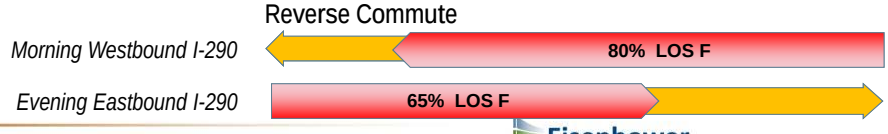
2040 PM Peak Period Arterial Congestion

Eisenhower expressway

Need Point #2: Improve Access To Employment



- Heavy congestion constrains access to jobs
- Access to jobs by auto from the study area will decrease by up to 33% by auto by 2040



Number of Jobs Accessible by Auto			
Travel Time (minutes)	2010	2040 Baseline	Change
Up to 15	107,000	79,000	-26%

Eisenhower expressway

Need Point #5: Improve Facility Deficiencies

Illinois Department of Transportation

- Address pavement age
- Address geometric, structure & drainage deficiencies
- Address ADA ramp & sidewalk deficiencies

Eisenhower expressway

Eisenhower expressway

Purpose and Need Comments

Illinois Department of Transportation

Purpose and Need Comments

Illinois Department of Transportation

- Additional Stakeholder Input Sought for Purpose and Need
  - Refined Purpose and Need publicly available on October 28, 2011
  - Formal review and comment period ended at midnight on November 30, 2011
  - 109 Comments during comment period
  - 21 comments on the Purpose and Need

Eisenhower expressway

Summary of Comments Received During the Formal Comment Period

Illinois Department of Transportation

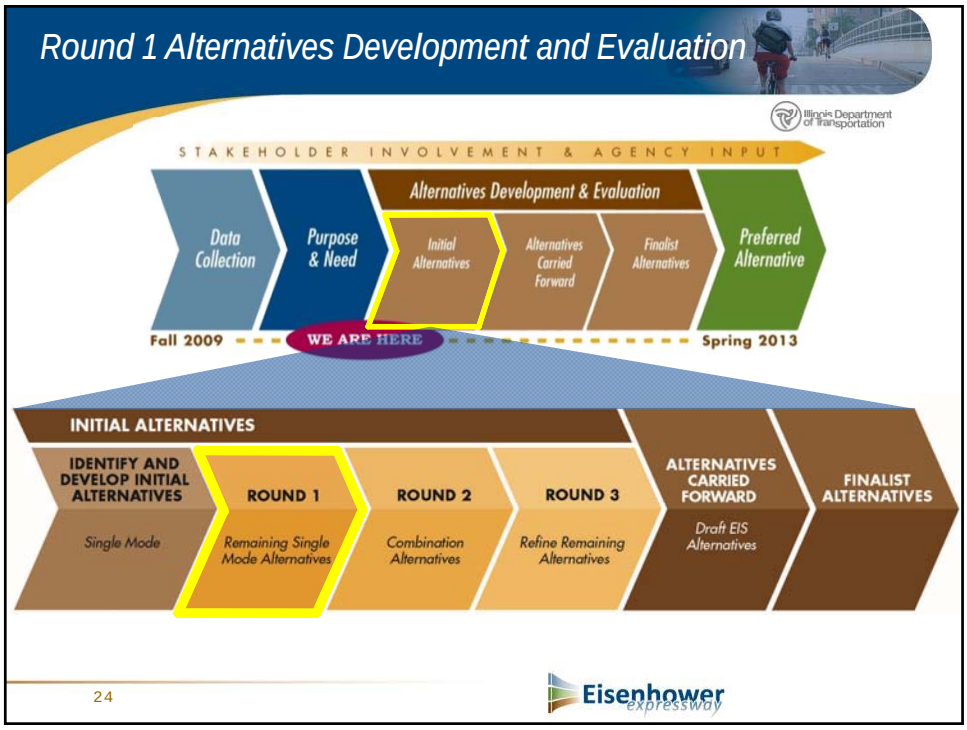
- Transit agency (CTA, RTA, FTA) comments:
  - Editorial comments
  - More emphasis on I-290 as a multi-modal corridor
  - Clarify working relationship with transit agencies
  - Request FTA as joint lead agency – *FTA accepted Cooperating Agency Status*
  - Inclusion of entire CTA Blue Line Forest Park Branch existing facility condition (state of good repair) as a formal need point

Eisenhower expressway

Summary of Comments Received During the Formal Comment Period

Illinois Department of Transportation

- Response regarding CTA Blue Line condition:
  - Existing transit facilities conditions to be described in EIS Affected Environment Section
  - Blue Line deficiencies in P&N imply a baseline condition to be addressed by IDOT - IDOT cannot take on a major CTA capital improvement
  - IDOT to address Blue Line improvement where affected by I-290 improvements
  - IDOT requested CTA initiate separate study for entire Blue Line Forest Park Branch (Categorical Exclusion)
    - Position CTA to capitalize on joint funding opportunities
    - Request initial study emphasis in I-290 Study Area



Summary of Comments Received During the Formal Comment Period

Illinois Department of Transportation

- Other Purpose & Need related comments received:
  - Place more emphasis on I-290 as a multi-modal corridor
  - Clarify working relationship with transit agencies
  - Consideration of environmental impacts
  - Alternative specific suggestions
  - Health Impact Assessment

Single Mode Alternatives Identification

- 570+ alternative related comments/ideas submitted
  - Corridor Advisory Group/Task Force Alternatives Workshop
  - Public Meetings
  - Website
  - E-Mail/Mail

Single Mode Alternatives Evaluation

- Alternatives grouped into categories by mode and similarity
- Categories reviewed for relevance to Purpose & Need and fatal flaws
- 22 alternatives identified for Single Mode evaluation:
  - 9 Transit
  - 11 Expressway & 2 Arterial
  - No Build
- Round 1 Evaluation included:
  - CMAP Regional Travel Demand Model – Travel Performance
  - Footprint impact & fatal flaw screening
  - Safety assessment

9 Single Mode Transit Alternatives	
Blue Line Extension (HRT)	Blue Line Extension - From Forest Park To Oak Brook Via IL Prairie Path & Butterfield Rd. (HRT 1)
	Blue Line Extension - From Forest Park To Oak Brook Via IL I-290 & I-88 (HRT 2)
	Blue Line Extension - From Forest Park To Mannheim Via I-290 (HRT 3)
Express Bus	Various service from DuPage and Northwest Cook Counties to Forest Park CTA terminal (EXP)
Bus Rapid Transit (BRT)	Oak Brook to Forest Park - Via Butterfield Road & IL Prairie Path (BRT 1)
	Oak Brook to Forest Park - Via I-88 & I-290 (BRT 2)
	Oak Brook to Cicero Avenue - Via I-88 & I-290 (BRT 3)
	Oak Brook to Ashland Ave - Via I-88 & I-290 – CTA Blue Line conversion (BRT 4)
	Lombard to Forest Park - Via I-88 & I-290 (BRT 5)

11 Single Mode Expressway Alternatives			
GP Add Lane			General Purpose Add Lane from I-88 to Central Avenue (GP)
Managed Lanes	**HOV Lanes**	**2+ riders**	Oak Brook to Racine Ave (HOV 2LL)
			I-88 to Racine Ave (HOV 2L)
			Oak Brook to Central Avenue (HOV 2W)
		3+ Riders	Oak Brook to Racine Ave (HOV 3LL)
			I-88 to Racine Ave (HOV 3L)
			Oak Brook to Central Avenue (HOV 3W)
	HOT Lanes		Oak Brook to Central Avenue, 3+ Vehicles Free (HOT 1)
			Oak Brook to Racine, 3+ Vehicles Free (HOT 2)
	Toll Lanes		Toll Existing I-290 Lanes, I-88 to Cicero Ave. (TOLL 1)
			Toll I-290 with Add Lanes , I-88 to Cicero Ave. (TOLL 2)

Travel Performance Measures

- Regional and Study Area:
  - Vehicle miles of travel (VMT) & Truck miles of travel (TMT)
  - Vehicle hours of travel (VHT) & Truck hours of travel (THT)
  - Vehicle hours of delay & Truck hours of delay
  - Congested VMT & Congested TMT
- Study Area
  - I-290 and arterial speeds and volume-capacity ratios
  - Person throughput (east-west highway & transit)
  - Safety (injuries & fatalities)
- Regional
  - New transit trips
  - Job accessibility (auto & transit)

Single Mode Alternatives - Expressway Conclusions

Findings: Expressway Alternatives...

- Have best improvement to I-290 travel performance
- Have best improvement to local & regional travel
- Improve peak period arterial performance
- Best improvement to job accessibility
- Best safety performance

Single Mode Alternatives- Transit Conclusions

Findings: Transit Modes…

- Do not improve I-290 performance
- Generates new transit trips, but diverts riders from other transit services
- Increased transit access to jobs
- Are compatible with expressway alternatives
- Majority of benefits of Blue Line extension to Mannheim vs. Oak Brook

Round 1 Conclusions – Alternatives Not Carried Forward

The following single mode alternatives will <u>not be carried forward</u>:

Illinois Prairie Path Transit Extension

- Similar Performance as alignment along I-290
- I-290 Alignment diverts fewer Metra UP-W riders
- Potential conflicts with recreational context

Existing Blue Line Conversion to BRT

- Blue Line conversion performance similar to Blue Line
- Potential capacity issues with BRT
- HRT & BRT have similar footprints
- Existing Blue Line will be modeled as representative mode

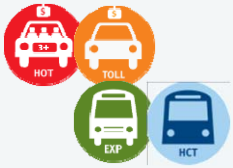
Moving Forward

Combination Alternatives Evaluation

- Round 2 – Combination Alternatives Screening
- 10 initial Combination Alternatives identified
  - All contain expressway mode capacity improvement
    - General Purpose Lanes, or
    - Managed Lanes (HOV, HOT, Toll)
  - All contain express bus (from Forest Park or Mannheim)
  - Each expressway / express bus alternative also paired with High Capacity Transit (HCT) extension along I-290 to Mannheim Road



10 Initial Combination Alternatives - Summary

Note: HCT is 'High Capacity Transit' - may be either BRT or Blue Line Extension (HRT)

GP Add Lane		**General Purpose Add Lane** from I-88 to Central Ave. with shoulder riding **Express Bus** from Forest Park to the west
		**General Purpose Add Lane** from I-88 to Central Avenue, **HCT** from Forest Park to Mannheim Rd., **Express Bus** from Mannheim Rd. to the west
HOV 2+		**HOV 2+** from I-88 to Racine Ave., **Express Bus** operating in **HOV Lane** from Forest Park to the west
		**HOV 2+** from I-88 to Racine Ave., **HCT** from Forest Park to Mannheim Rd, **Express Bus** from Mannheim Rd. to the west
HOT 3+		**HOT 3+** from I-88 to Racine Ave., **Express Bus** operating in **HOT Lane** from Forest Park to the west
		**HOT 3+** from I-88 to Racine Ave., **HCT** from Forest Park to Mannheim Rd., **Express Bus** from Mannheim Rd. to the west

10 Initial Combination Alternatives - Summary *(Continued)*

Note: HCT is 'High Capacity Transit' - may be either BRT or Blue Line Extension (HRT)

TOLL		**Add lane** from I-88 to Central Ave., **Toll 1 lane** in each direction from I-88 to Racine Ave., and **Express Bus** operating in Toll lane from Forest Park to the west
		**Add lane** from I-88 to Central Ave., **Toll 1 lane** in each direction form I-88 to Racine Avenue, **HCT** to Mannheim Road, and **Express Bus** from Mannheim Rd. to the west
HOT 3+ & TOLL		**Add HOT 3+ lane** from I-88 to Central Ave., **convert 1 existing lane** in each direction to **HOT 3+ lanes** from Central Ave. to Racine Ave. , **Toll remaining lanes** from I-88 to Racine Ave., and **Express Bus operating in HOT Lane** from Forest Park to the west
		**Add HOT 3+ lane** from I-88 to Central Ave., **convert 1 existing lane** in each direction to **HOT 3+ lanes** from Cent to Racine Ave., **Toll remaining lanes** from I-88 to Racine Ave., **HCT** from Forest Park to Mannheim, and **Express Bus** from Mannheim Rd. to the west

Illinois NEPA/404 Merger Meeting

January 13, 2012

I-290 (Eisenhower Expressway)
US 12/20/45 (Mannheim Road) to Illinois Route 50 (Cicero Avenue)
Job No. P-91-201-00
Cook County

This was the third presentation of the I-290 project to the Illinois NEPA/404 Merger Team. The meeting was held at 3:30 pm. The purpose of the meeting was to provide a study briefing and update the Merger team on the status of the study. It should be noted that in the September 2009 meeting, the NEPA/404 Merger team concluded that this study will not require formal concurrence, and that the study may continue as an 'EIS with agency review,' using the scheduled NEPA/404 merger team meetings to provide study updates.

IDOT District 1 and the project consultant presented a PowerPoint presentation to the Merger Team and FHWA. The presentation provided a brief recap of the study background, the study process, stakeholder involvement, purpose and need, and the alternatives development & evaluation process.

Purpose and Need

A brief summary of the 5 main purpose and need points were presented, followed by a summary of the stakeholder comments received during the 30 day review period that ended on November 30, 2011. Twenty-one of the 109 comments submitted during this period were related to purpose and need. Comments were received by the Chicago Transit Authority (CTA), Regional Transportation Authority (RTA), and the Federal Transit Agency (FTA) who has accepted Cooperating Agency status. These agencies were seeking to have the state of good repair needs for the entire CTA Blue Line Forest Park Branch included in the I-290 Purpose and Need. IDOT's response is that by including the existing Blue Line needs as part of the I-290 Purpose and Need, it would imply a condition required to be addressed by IDOT. IDOT cannot take on a major capital maintenance improvement for another agency, but would be required to address improvements where the CTA was affected by the I-290 project. IDOT will include the condition of the CTA Blue Line in the affected environment section of the Draft Environmental Impact Statement and requested that CTA initiate a separate study of the Blue Line Forest Park Branch to facilitate and capitalize on joint funding opportunities.

Alternatives Identification and Evaluation

The alternatives evaluation process and progress to date was summarized. The process consists of 3 rounds of evaluation that precede the identification of the Alternatives to Carry Forward. Over 570 alternative suggestions were received from the stakeholders since the first public meeting in November of 2009. The alternatives were grouped by mode and similarity into 33 categories, which were then reviewed for fatal flaws and relevance to purpose and need. In Round 1, single mode alternatives were evaluated to understand how each individual mode addresses the transportation needs. Twenty-two single mode alternatives were identified for evaluation in Round 1, consisting of nine transit alternatives (Blue Line Extensions, Bus Rapid Transit, Blue Line Conversion to BRT, Express Bus Service) and 11 expressway alternatives (general purpose add lane, High Occupancy Vehicle lanes, High Occupancy Toll lanes, and general toll lanes).

The single mode evaluation determined that the expressway alternatives provide the best performance improvements for I-290 travel, best local and regional travel, arterial travel, and safety improvements, as well as the best improvement in job accessibility. Transit alternatives did not provide improvements to I-290 performance, but did provide an increase to jobs via transit and generated new transit trips, but also diverted trips from other transit services in the study area. It was also found that the majority of the travel benefits of a Blue Line extension are provided by an extension to Mannheim, versus an extension to Oak Brook, and at half the length.

Two single mode transit alternatives were also dropped from further consideration: fixed guideway transit extensions along the Illinois Prairie Path, and conversion of the existing Blue Line Forest Park Branch to a Bus Rapid Transit system.

The interim draft Alternatives Evaluation Report was made available for comment on the public website. The 30+ day comment period will end on January 23, 2011.

Next Steps

The next step in the alternatives evaluation process is to evaluate an initial set of Combination Mode alternatives in Round 2. The results of the Round 2 evaluation will be used to identify and refine a more condensed set of alternatives for evaluation in Round 3. Rounds 2 and 3 will also include a purpose and need test, and round 3 will consider environmental effects. The goal at the end of Round 3 is to identify the Alternatives to Carry Forward for evaluation in the DEIS.

Ten combination mode alternatives have been identified and are currently under evaluation. These included combinations of expressway capacity improvements, express bus service, and high capacity transit extensions form the Forest Park CTA station. Expressway modes included some Tolling and High Occupancy Toll lanes both as added capacity and by converting existing lanes to HOV, HOT, or Toll. The study team will be coordinating with the FHWA regarding federal tolling policies.

The USEPA asked what the study Timeline was. IDOT explained that the timeline goals are to hold the next public meeting in June 2012, a draft EIS in a year, followed by a Record of Decision in late 2013.

The USEPA requested that IDOT distribute the Purpose and Need comments and responses to the Merger Team.

IDOT – John Baczek, Mark Peterson, Pete Harmet
Consultant Team – Bryan Kapala, Ron Shimizu

cta
CTA BLUE LINE VISION STUDY
CTA Blue Line Forest Park Branch Feasibility/Vision Study

What is the Blue Line Feasibility / Vision Study?

CTA BLUE LINE VISION STUDY

- Opportunity to assess current conditions
  - Modernization needs exist for rail infrastructure and customer amenities
- Planning for modernization
  - Near-term (10 years)
  - Long-term (2040)
- Early outreach and comment opportunity for project stakeholders
- Recommendations will inform IDOT's I-290 Phase 1 Study

The study is not…

- Environmental Impact Statement
- Part of a Federally mandated project development process

I-290 Next Steps

- Geometric refinement of remaining alternatives
- Cross-road and interchange design refinements
- Build population and employment forecast(s) (CMAP coordination)
- DEIS Level Evaluation:
  - Air and noise
  - Environmental Justice
  - Cost Estimates
  - Etc.
- Incorporate CTA Vision Study findings
- Stakeholder coordination

Eisenhower expressway

I-290 Next Steps

- One on One communities/agency meetings – ongoing
- Community Advisory Group Meeting #16 – July 17
  - Close out Round #2/address stakeholder comments
  - Discuss scope of next round of evaluation
  - Introduce aesthetic treatments
  - Conduct joint CTA/IDOT bike/pedestrian access workshop
  - CTA Vision Study update
- Public Meeting #3 – September/October
- Community Advisory Group Meeting #17 – December
- Draft EIS release – April 2014
- Public Hearing – May 2014
- Phase I study completion – Fall 2014.

Eisenhower expressway

NEPA/404 Merger Meeting Summary

June 25, 2013

I-290 (Eisenhower Expressway)
US 12/20/45 (Mannheim Road) to Illinois Route 50 (Cicero Avenue)
Job No. P-91-597-10
Cook County

IDOT District 1, Cook County
Interstate 290 (I-290)
Environmental Impact Statement
Information – Alternatives Evaluation

This was the fourth presentation of the I-290 project to the NEPA/404 Merger Team. The purpose of the meeting was to provide a Study briefing and update the Merger Team on the status of the Study. It should be noted that in the September 2009 meeting, the NEPA/404 Merger Team concluded that this Study will not require formal concurrence, and that the Study may continue as an EIS with agency review, using the scheduled NEPA/404 merger team meetings to provide Study updates.

IDOT District 1 (IDOT) and the project consultant Parsons Brinckerhoff presented a PowerPoint presentation to the Merger Team and FHWA. The presentation provided a brief recap of the study progress since the last meeting including: completion of Round 2 alternatives evaluation, initial interchange concepts and coordination, formally extended study area 4 miles to the east, updated the existing conditions evaluation, updated the Purpose and Need, began CTA Vision study Coordination and held 3 Corridor Advisory Group (CAG) Meetings. Due to the amount of coordination and work these tasks have required, the last CAG meeting was held February 21, 2013 and the next meeting is targeted for July 17, 2013.

<u>Alternatives Evaluation</u>
A brief summary of the combination alternatives was presented followed by a discussion of the alternatives scoring methodology. Ten combination mode alternatives were evaluated that included combinations of expressway capacity improvements, express bus service, and high capacity transit extensions from the Forest Park CTA station to Mannheim Road. Expressway modes included Tolling and High Occupancy Toll lane alternatives both from the standpoint of added capacity and converting existing lanes to HOV, HOT, or Toll. The alternatives scoring was based on Purpose and Need score by sum of Need Point Average. Based on the scoring of ten combination mode alternatives, it was determined that four alternatives should be advanced for further evaluation in the DEIS (see attached). These four include:

- Add GP (one in each direction) Lane, Blue Line Extension, and Express Bus,
- Add HOV 2+ (one in each direction), Blue Line Extension and Express Bus,
- Add HOT 3+ (one in each direction), Blue Line Extension and Express Bus

- Add HOT 3+ (one in each direction), Toll remaining lanes, Blue Line Extension and Express Bus

Based on modeling results, it was determined that stand-alone transit alternatives did not provide improvements to I-290 performance, but did provide an increase to jobs accessible via transit and generated some new transit trips, but also diverted trips from other existing transit services in the study area. Compared to a High Capacity Transit (HCT) extension to Oak Brook, it was found that the majority of the travel benefits of a Blue Line extension are provided by an extension to Mannheim Road, at half the distance to Oak Brook.

Our updated evaluation of Round 2 alternatives included two new "non widening" alternatives that were suggested by the Village of Oak Park and Citizens for Appropriate Transportation (CAT) (see attached Round 2 Non Widening Alternatives); these alternatives include features that would further restrict flow on I-290 (i.e., the Village plan calls for high toll rates on all lanes, the CAT plan calls for converting the existing inside lanes to managed lanes). The effect of these strategies was a diversion of traffic from I-290 onto an already congested arterial system. As such, these alternatives did not perform well enough to be carried further.

<u>Agency questions and comments on the Alternatives</u>
The USEPA asked whether shoulders will be converted to through lanes? IDOT stated no, the shoulders are not wide enough for conversion. Widening for additional lanes will occur to the outside of the existing roadway. Reservation for a future Blue Line Extension would occur in the roadway median.

The USEPA asked how are tolls to be collected? IDOT stated that tolls will be collected electronically using automated toll collection devices located on gantries above each tolled lane.

The USEPA asked how HOV riders are to be accounted for? IDOT responded that there would have to be enforcement to verify that drivers are complying with the requirements of the HOV or HOT lane. Also, technological advances may allow for electronic enforcement or verification.

USEPA stated that all of the alternatives appear to include a Blue Line Extension, which IDOT confirmed, and also noted that there would also be an independent collector-distributor bus service at the end of the line feeding into the terminal station.

The USEPA stated that there appears to be a large existing parking area at Mannheim Road on the south side near shopping areas. IDOT replied yes, there may be opportunities to develop park and ride facilities at these locations.

The USEPA asked whether the transit agencies were supportive of the extension. IDOT stated that the CTA Vision Study will focus on the existing Blue Line, while the extension would be a lower priority. IDOT will lead the planning for the extension and provide accommodation for a future westward extension in the median. The CTA wants

to call the extension High Capacity Transit (HCT) instead of Heavy Rail Transit (HRT) in order to provide options for future development and investigate costs.

The USEPA asked if IDOT was pleased with the range of alternatives. IDOT said yes, they were because they did not know what the outcome of the evaluation would be. Also, the top four alternatives represent a good range for evaluation in the next round.

Purpose and Need

A brief summary of the five main Purpose and Need points were presented, followed by a presentation of the Extended Study Area update to the Purpose and Need. A four mile extension of the Study Area was required in order to fully encompass the extent of the Round 3 alternatives. Because the Regional Travel Model already encompassed this area, no re-evaluation of the existing alternatives modeling was required. The study area now includes the entire 13 miles between the I-88 interchange and the western study limit of the Circle interchange.

Existing conditions assessment was completed to determine mainline facility condition, operations and safety in similar detail to what was previously performed in the six-lane reconstruction section between I-88 and Cicero Avenue. In general, the eight lane section has more favorable design elements, operations (mainline and arterials), and safety performance than the six-lane section. Pavement conditions are slightly better in that a 1.2 mile long segment was replaced in the mid 1980's. Condition and age of the overhead bridges in the extended study area are comparable to what was found in the original study area to the west. It should be noted, that the eight lane section is not being widened and, as a result, the corridor is not being reconfigured. All of the overhead bridges will be studied for replacement, however, as part of a separate study beginning this fall. Interchanges will remain unaffected by mainline operational improvements and are adequate for future transportation needs as determined by operational analysis. Therefore, they will not be improved except to address bridge condition.

Air and Noise studies will be conducted throughout the entire 13 mile length of the study including through the 4 mile extended study area recently added.

Agency questions and comments on the Purpose and Need

The USEPA questioned whether the I-88/I-290/I-294 Hillside interchange is included in the study area. IDOT stated that I-88 converges into one lane as it approaches the Eisenhower. Although the I-290 mainline was not reconstructed during the Hillside interchange construction, everything that was constructed in 2001 as part of the Hillside interchange project is designed to accommodate mainline reconstruction and capacity improvements without reconfiguration.

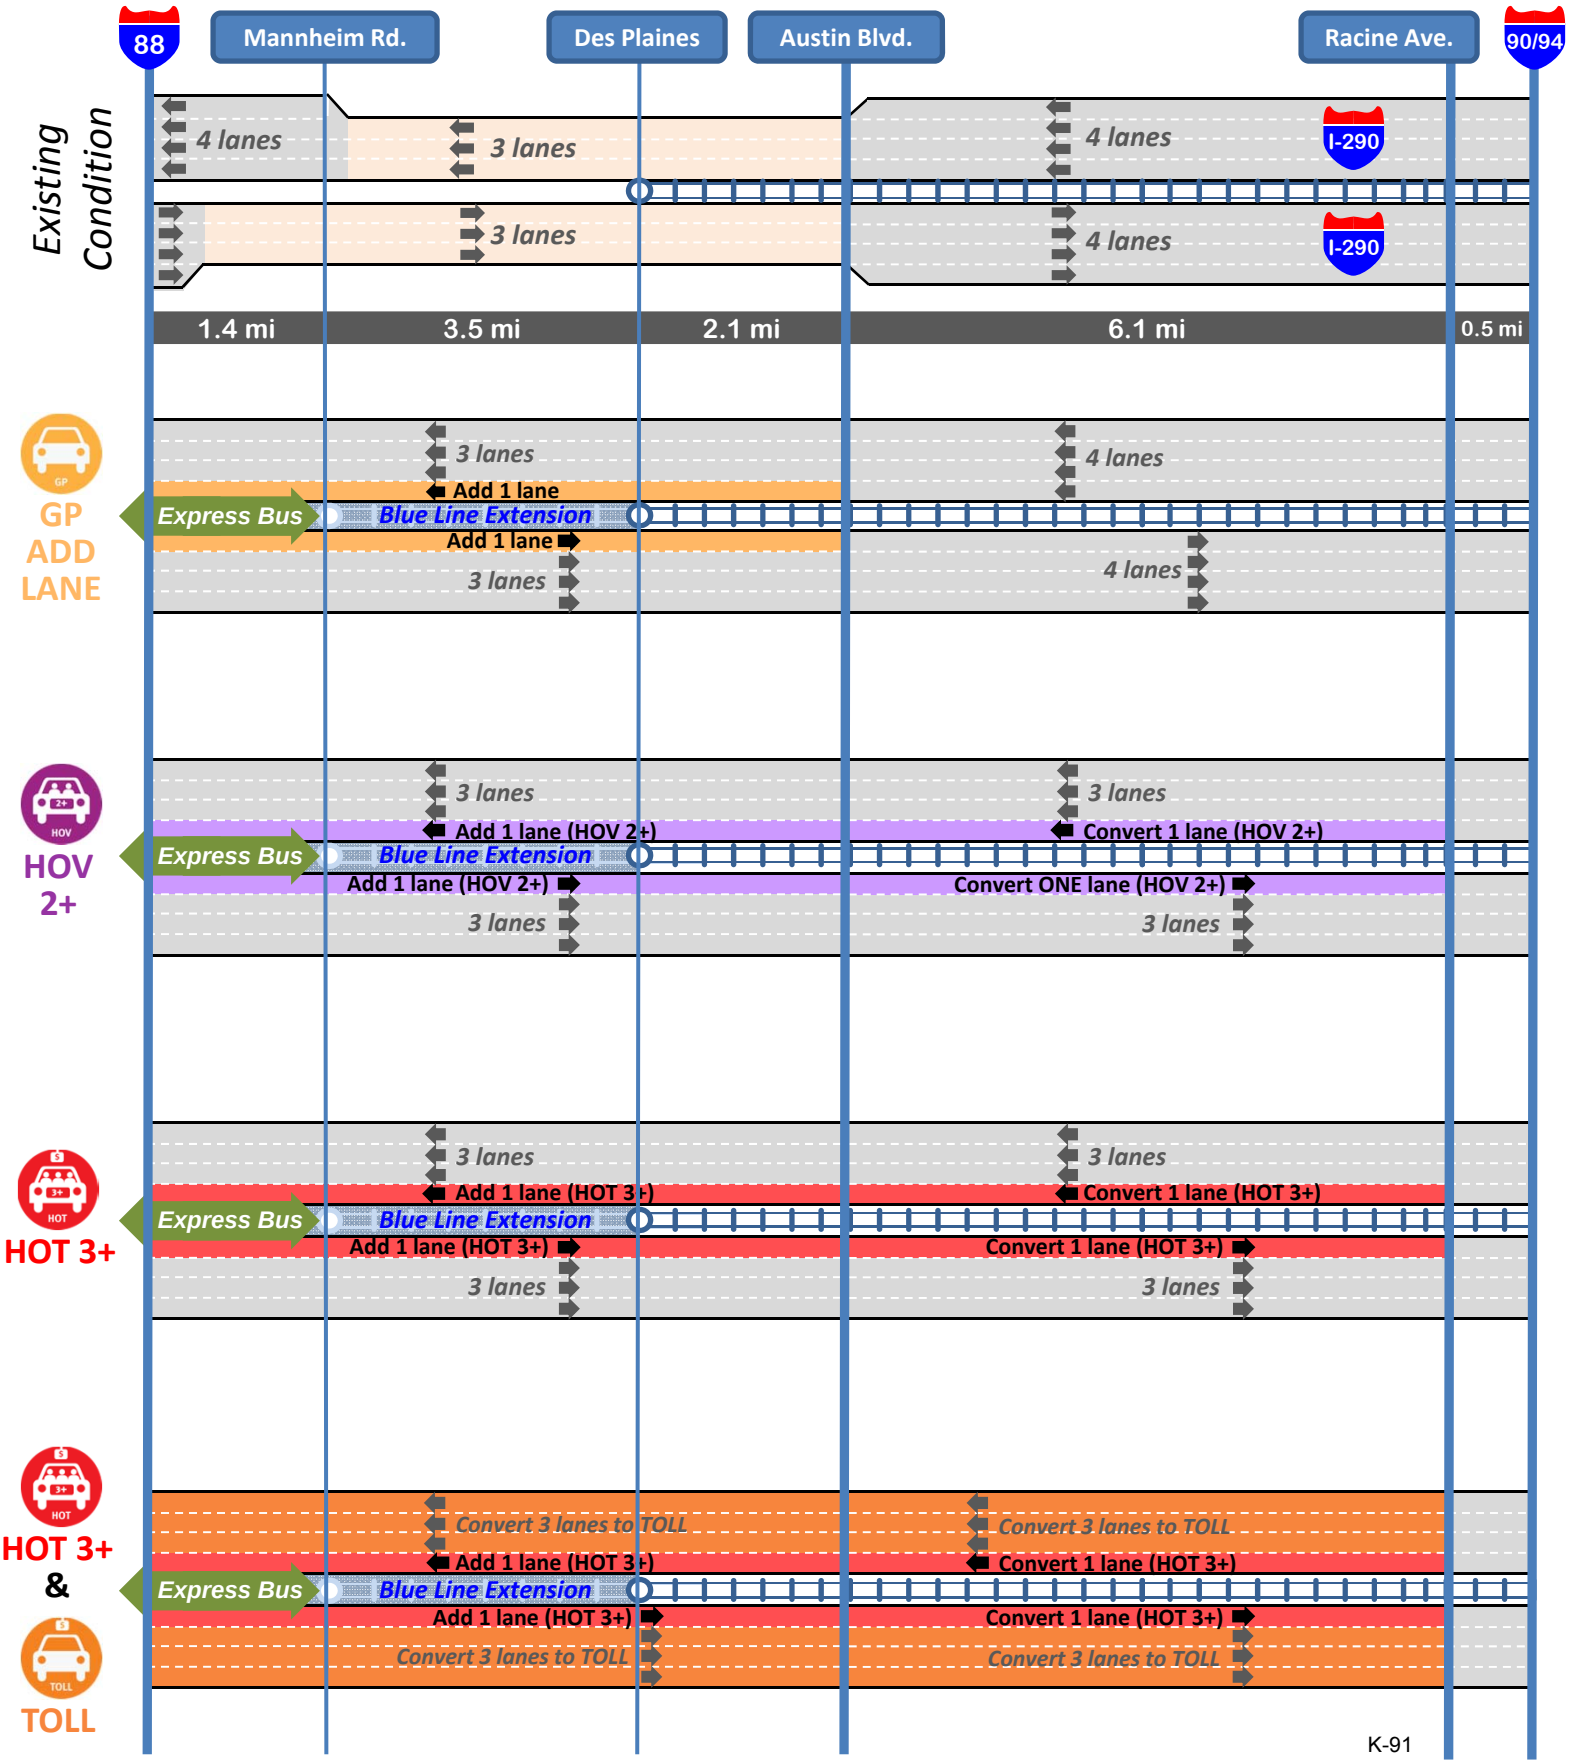
USEPA asked whether design standards are met for the bridges over the expressway? IDOT stated that many of the bridges over the expressway do not meet current design standards. During this study, they will be designed to current standards and reviewed for adequacy to serve future needs including Complete Streets requirements.

The USEPA asked whether restriping will provide more lanes in the eight lane section. IDOT answered no; restriping is required to convert one of the four existing lanes (in each direction) into managed lane. This may include a small buffer area between the managed lane and general purpose lane. No widening is anticipated.

The USEPA asked whether the managed lane operation extends into the eight lane section? IDOT stated that this was the impetus behind extending the study area an additional four miles; to encompass the operations of the managed lanes east of Cicero. The inside, median lane may be converted to an HOT 3+, HOV 2+ or remain as a General Purpose lane; to be evaluated in Round 3. The managed lane option would end west of the Circle interchange.

CTA Vision Study

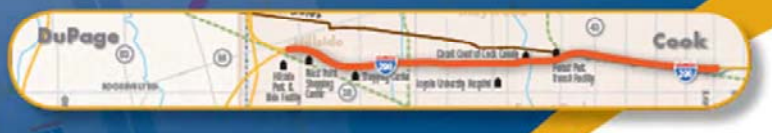
The CTA has initiated the Blue Line Vision Study to assess current conditions, plan for modernization and provide opportunity for public input on long term modernization strategies for the Blue Line Forest Park branch. This study will provide recommendations to the I-290 Study to facilitate improved modal connectivity between the transit stations and expressway, arterials, pedestrians and bicycles modes.



Next Steps

The next step in the alternatives evaluation process is to perform a DEIS evaluation of the remaining four alternatives. This will require the development of geometry for refinement of the roadway and interchanges, to provide the necessary detail for Air and Noise Studies, cost estimates and environmental justice determination. The Build Population and Employment forecast will be completed and coordinated through CMAP. Stakeholder involvement will include coordination with CTA on the Vision Study findings and one-on-one meetings with communities to refine cross-street and interchange preliminary design.

Eisenhower expressway



I-290 Phase I Study - *Round 3*

Combination Mode Alternative Descriptions

NEPA/404 Merger Team Meeting

February 27, 2014

Illinois Department of Transportation

Eisenhower expressway

Agenda

Illinois Department of Transportation

- Study progress since last meeting (June 2013)
- Alternatives Carried Forward
- Public Meeting #3
- CTA Vision Study Coordination
- Next Steps

Study Progress

Illinois Department of Transportation

Last meeting recap (June 2013):

- Revised Purpose & Need - Study area extension to the east
- Round 2 evaluation results
- Four alternatives identified for further evaluation in Round 3
- CTA vision study coordination
- Corridor Advisory Group meetings held
- Interchange concepts & coordination

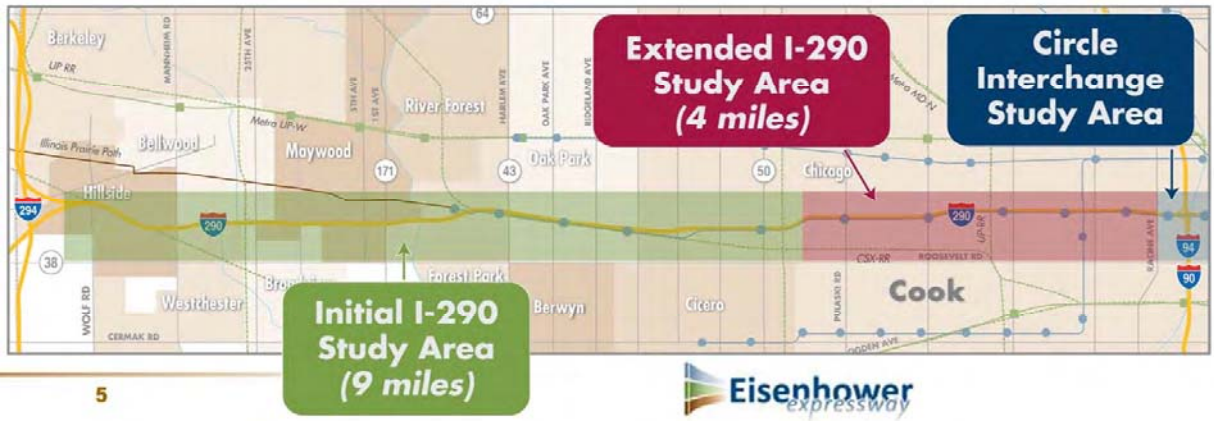
Eisenhower expressway

Study Progress

Illinois Department of Transportation

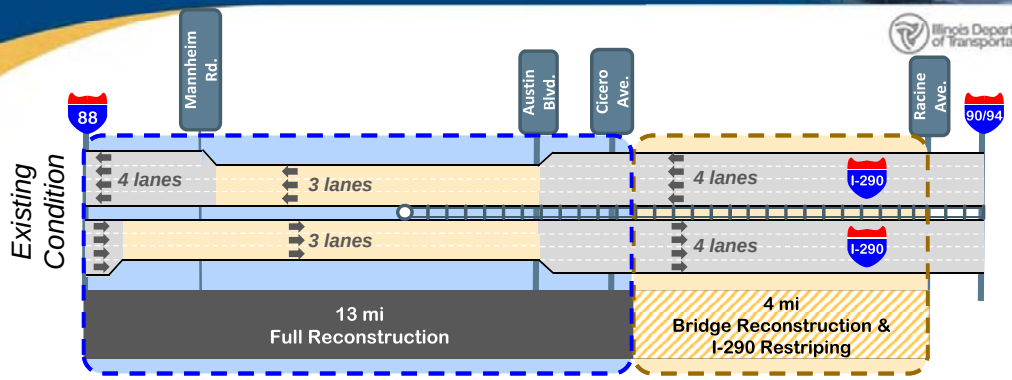
Progress since last meeting:

- Identified four alternatives to be evaluated in the DEIS
- Round 3/DEIS alts travel demand modeling (ongoing)
- Interchange concept & design refinements
- CTA Vision Study & CSX coordination
- 2 CAG Meetings (Round 2 wrap-up, bike & pedestrian workshop)
- Public Meeting # 3 (two locations)
- Town Hall Meeting, stakeholder meetings
- Air & noise analysis preparations



Eisenhower expressway

I-290 Study Area

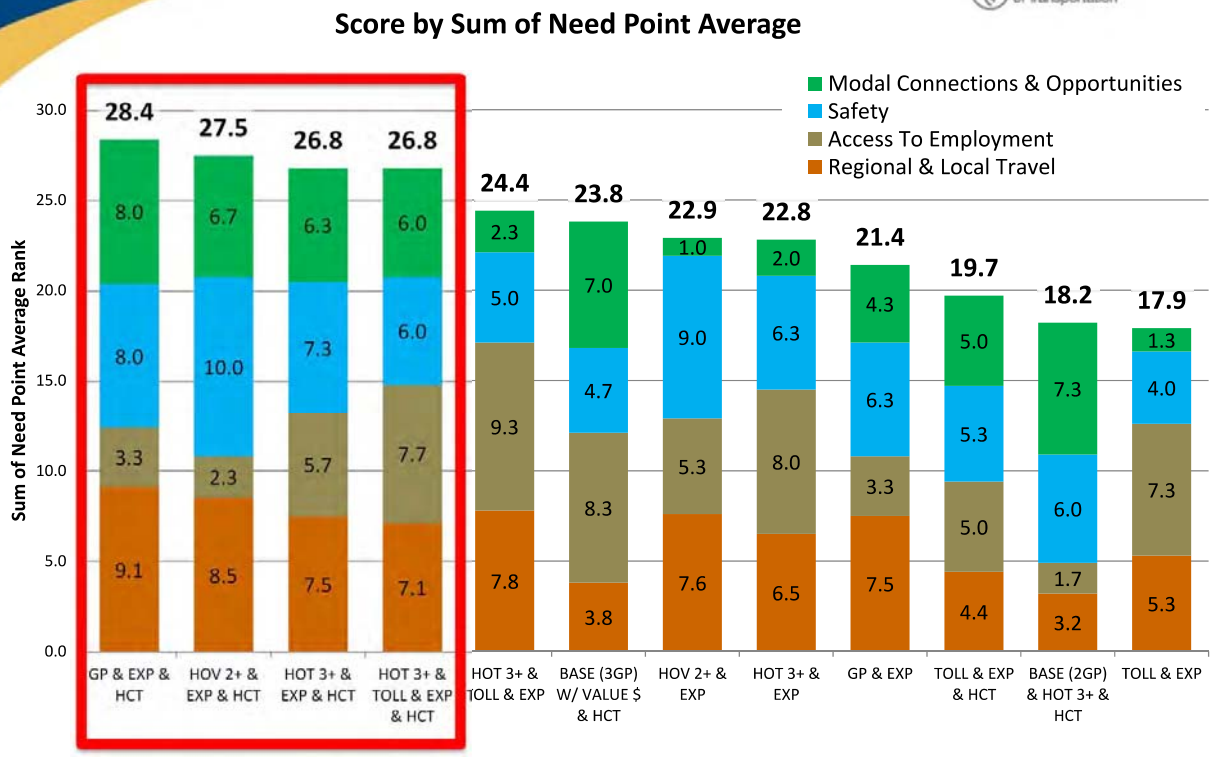


Illinois Department of Transportation

Study Area:

- Formally extended overall study area 4 miles to the east
- Encompasses extent of Round 3 alternatives
- Matches up with Circle Interchange Study at Racine Avenue
- 13 mile overall study area length I-88 to Circle

Reconstruction and Restriping

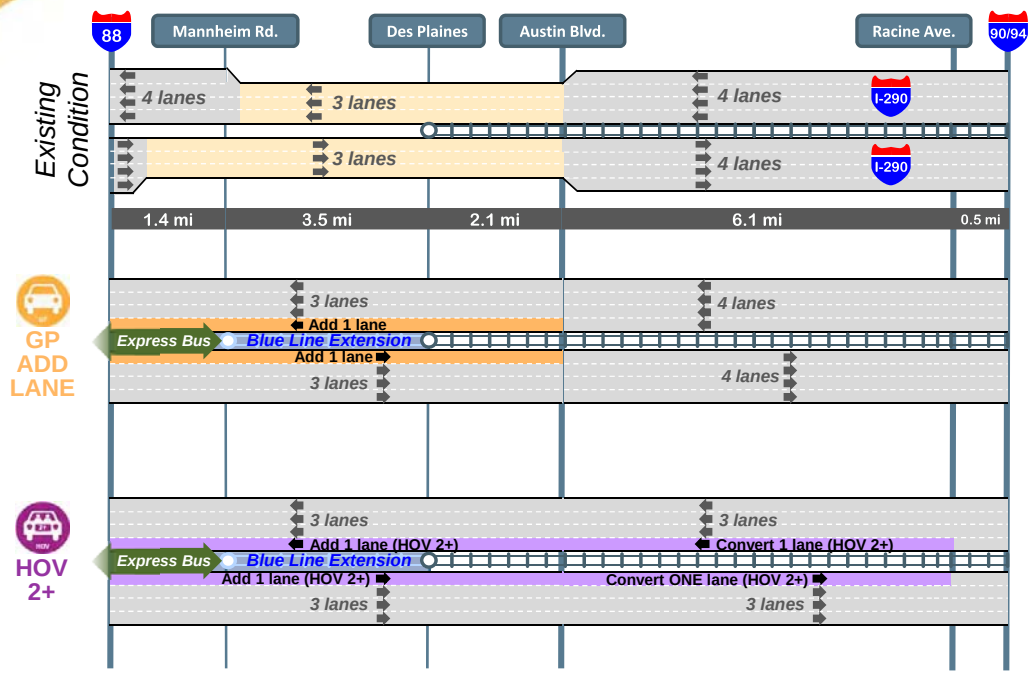


Full Reconstruction:

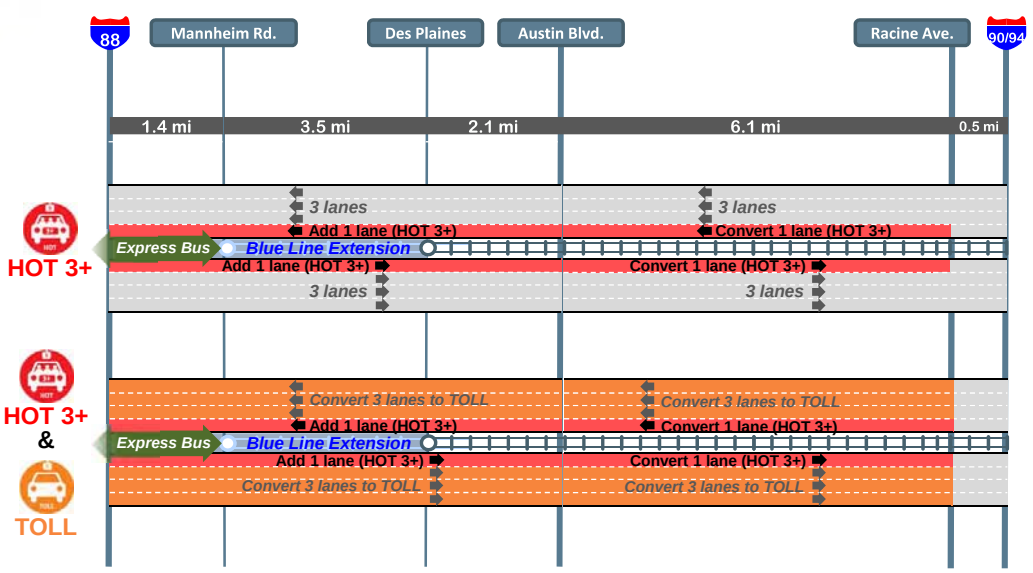
- Remove bottleneck
- Address left-hand ramps
- Accommodate transit extension
- Address structure & pavement age
- Address drainage issues

Restriping & Bridge Reconstruction:

- Reconstruct overhead bridges – as part of separate project(s)
- If managed lane is selected:
  - Restripe I-290 for HOV or HOT lane
  - Spot roadway improvements for managed lane infrastructure (gantries)



Round 2 - Combination Alternatives Modeling Results



Round 2 Observations

- Lane addition:
  - Improved I-290 travel times
  - Improved arterial travel (except for tolling all lanes)
  - Improved safety performance
- Managed Lane:
  - Offers improvements in GP lane travel time
  - Moves more people through the corridor
  - Improved accessibly to regional jobs

Round 3 / DEIS Alternatives

Round 3 / DEIS Alternatives

Common Elements of Alternatives

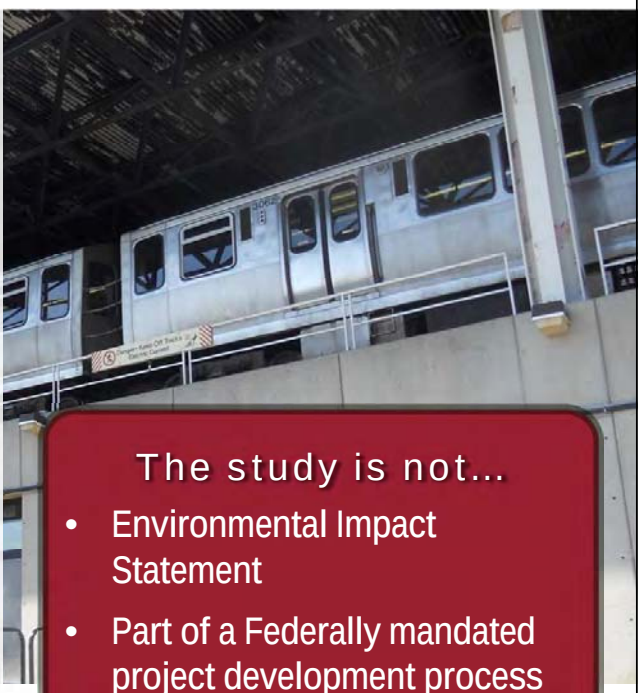
- Additional lane each direction west of Austin Blvd.
- Overhead bridge reconstruction/restriping east of Cicero Ave. (separate studies)
- Mainline design accommodates space for future Blue line Extension to Mannheim Road
- Interchange locations and type
- Similar footprints
  - Evaluations regarding use of CSX & CTA ROW in progress

Public Meeting #3

- Joint meeting with CTA
- Two locations to encourage participation
  - Oct. 7 – Chicago Marriot: 45 attendees
  - Oct. 8 – Proviso Math & Science Academy: 158 attendees
- Continuous narrated powerpoint, exhibit area, interchange visualizations, moderated Q & A sessions

Public Meeting #3 Comment Themes

- 40 Comment Forms/61 Q&A Cards Submitted:
  - Tolling
  - Improved signage
  - Height & location of ramps (Harlem & Austin)
  - Air & noise
  - Safety
  - Bridge repairs
  - Pedestrian access/paths
  - Bike lanes
  - Blue Line extension
  - Bus rapid transit/BRT
  - CTA station improvements
  - Managed lanes
  - Funding



CTA BLUE LINE VISION STUDY

CTA Blue Line Forest Park Branch Feasibility/Vision Study

What is the Blue Line Feasibility / Vision Study?

- Opportunity to assess current conditions
  - Modernization needs exist for rail infrastructure and customer amenities
- Planning for modernization
  - Near-term (10 years)
  - Long-term (2040)
- Early outreach and comment opportunity for project stakeholders
- Recommendations will inform IDOT's I-290 Phase 1 Study

The study is not...

- Environmental Impact Statement
- Part of a Federally mandated project development process

Vision Study Findings

- CTA focus on modernization of existing facility – not planning for an extension at this time.
- Third express track not needed
  - Potential express service – limited time savings
  - Insufficient ROW to add third track and 24' wide platforms in trench
- Forest Park Terminal Modernization
  - Evaluating site for new terminal/yard/shop
  - Improved access to terminal bus/auto/pedestrians
- Recommendations to improve stations
  - Wider platforms
  - ADA accessibility
  - Improved weather and noise protection

I-290 Next Steps

- Additional engineering and DEIS preparation
- Stakeholder meetings – Ongoing
- Community Advisory Group Meetings – Spring/Summer 2014
- Draft EIS release – Late 2014
- Public Hearing – Fall/Winter 2014

DRAFT
NEPA/404 Merger Meeting Summary
February 27, 2014

IDOT District 1, Cook County
Interstate 290 (I-290)
Environmental Impact Statement
Information – Alternatives Carried Forward

This was the fifth presentation of the I-290 project to the NEPA/404 Merger Team. The purpose of the meeting was to update the Merger Team on the status of the Study and present the alternatives being carried forward into the Draft Environmental Impact Statement. It should be noted that in the September 2009 meeting, the NEPA/404 Merger Team concluded that this Study will not require formal concurrence, and that the Study may continue as an EIS with agency review,' using the scheduled NEPA/404 merger team meetings to provide Study updates.

IDOT Region 1 (IDOT) and the project consultant presented a PowerPoint presentation to the Merger Team and FHWA. In advance of the meeting, Merger Team was provided the *I-290 Phase I Study - Alternatives Carried Forward* document that summarized the alternatives identification and evaluation process that led to the selection of the four alternatives being carried forward for evaluation in the DEIS. The presentation provided a brief recap of the study progress since the last meeting including: identification of the four alternatives being carried forward into the DEIS, travel demand modeling of DEIS alternatives (ongoing), interchange concept & design refinements, CTA Vision Study and CSX Railroad coordination, Corridor Advisory Group meetings held, Public Meeting #3 held (two locations), stakeholder meetings, and preparations for air quality and noise evaluations.

<u>DEIS Alternatives</u>
As part of the presentation, a description of the four DEIS alternatives was presented. These four include:

- GP Lane, High Capacity Transit Extension, and Express Bus,
- HOV 2+, High Capacity Transit Extension and Express Bus,
- HOT 3+, High Capacity Transit Extension and Express Bus
- HOT 3+, Toll remaining lanes, High Capacity Transit Extension and Express Bus

Each of the four alternatives include an add lane in each direction west of Central Avenue, provisions for extending high capacity transit in the median of I-290 from the Forest Park CTA Terminal to Mannheim Road, similar interchange locations and types, and similar footprints. The primary difference in the four alternatives is how the expressway lanes are managed.

Full reconstruction of the I-290 is proposed from the west of Mannheim Road to just east of Cicero Avenue. Reconstruction of the approximately 4 mile eight lane section of I-290 from east of Cicero to Racine Avenue is not proposed to be reconstructed. However, the

condition of the overhead bridges in this section is being evaluated for improvements as part of separate studies.

CTA Vision Study:

The CTA is wrapping up its own evaluation of the existing CTA Blue line to identify its modernization and improvement needs in the I-290 Corridor. The recommendations of this study are also being used to inform IDOT's I-290 Phase I study. The current findings that affect the I-290 Phase I Study are:

- CTA's priority is modernization of the existing Blue Line and is not currently considering a western extension of the blue line
- A third express track is not needed between Forest Park and the Loop.
- Existing station locations are not expected change between Austin Boulevard and the CTA Forest Park Terminal.
- Existing station platforms need to be improved for ADA accessibility, including wider platforms to 24', improved head stations at street level, and elevator access. Due to the wider platforms, a third track will not fit in the remaining right of way.
- Need for a new terminal, yard, and shop at the current CTA Forest Park Terminal location. The current facility is over 50 years old.

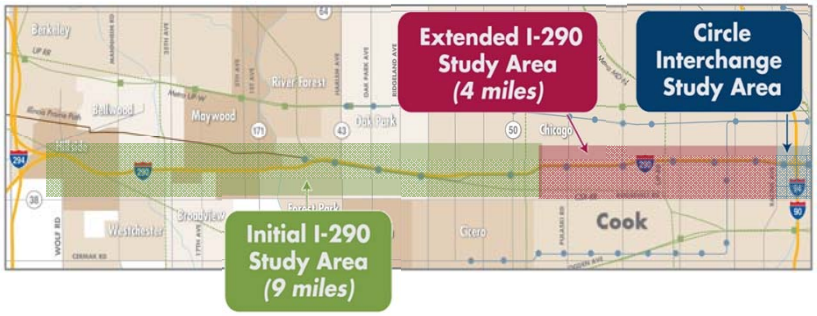
Next Steps

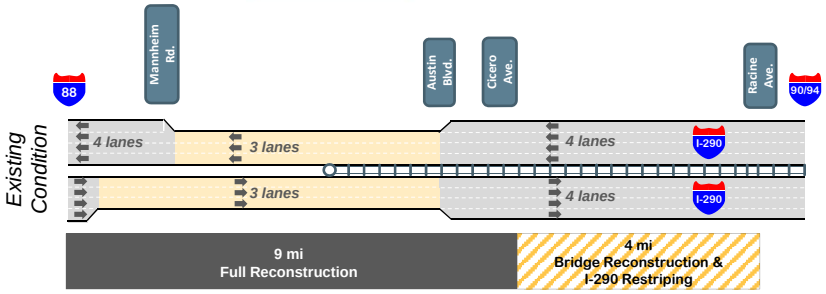
The evaluation of the four DEIS alternatives is anticipated to continue into summer/fall 2014 including design and engineering refinements to the mainline and interchanges, and air and noise studies. Additional Corridor Advisory Group meetings will be held around the same time frame in anticipation for a release of the DEIS in late 2014 followed by a Public Hearing.

Agency questions and comments on the Alternatives

The USEPA asked what safety measures are being considered near the CTA Station access points at the interchanges. IDOT explained that many safety improvements are being incorporated into the designs at Harlem Avenue and Austin Boulevard including wider sidewalks and pedestrian plaza areas, pedestrian refuge islands and improved crossings, modernized signals, and bus pull outs. Dual head stations (one on either side of the street) were considered by the CTA Vision Study, but are not proposed.

Agenda

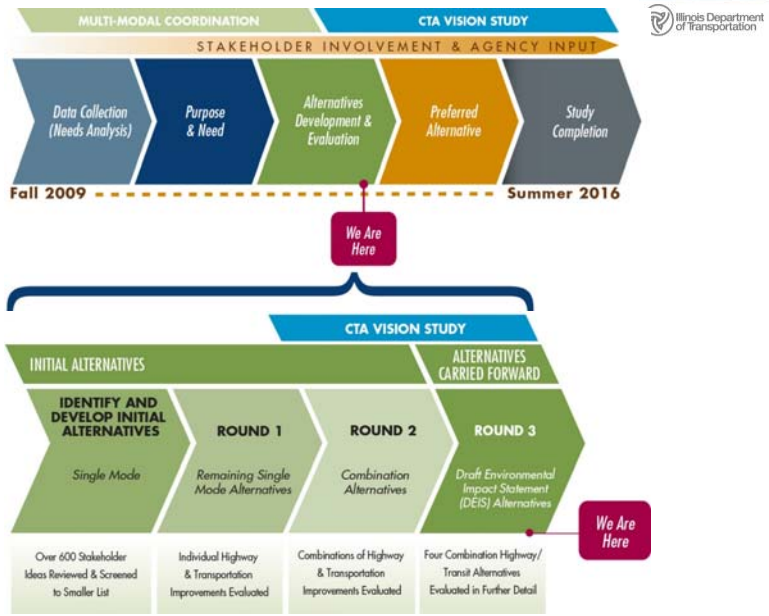




Illinois Department of Transportation

- Study Overview
  - Study Area
  - Study Process
  - Public Involvement
  - Purpose & Need
  - Round 1 Single Mode Alternatives Screening
  - Round 2 Combination Mode Alternatives Screening
  - Round 3 DEIS Alternatives
  - CTA Blue Line Vision Study
- Preliminary Preferred Alternative Recommendation
- Next Steps

2

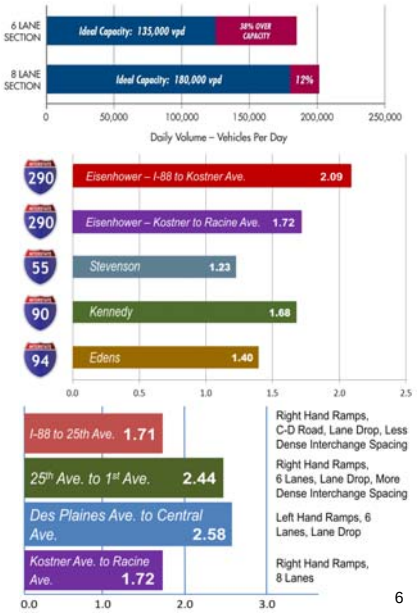


I-290 Study Area

3

Study Process Overview

4



Public Involvement Opportunities

5

I-290 Purpose and Need

- PURPOSE: *to provide an improved transportation facility along the I-290 multimodal corridor*
- NEED: Five specific need points to be addressed:
  - *Improve regional and local travel*
  - *Improve access to employment*
  - *Improve safety for all users*
  - *Improve modal connections and opportunities*
  - *Improve facility deficiencies*
- Purpose and Need was provided to public for review

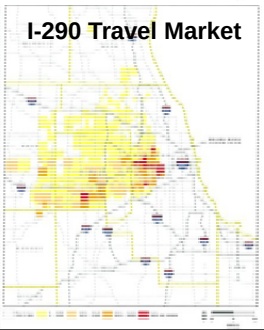
6

Round 1 – Single Mode Evaluation

- 570+ stakeholder suggestions
  - Transit, highway, bicycle & pedestrian modes
- Stakeholder suggestions condensed into 33 concept categories
  - Roadway, Transit, Related Improvements

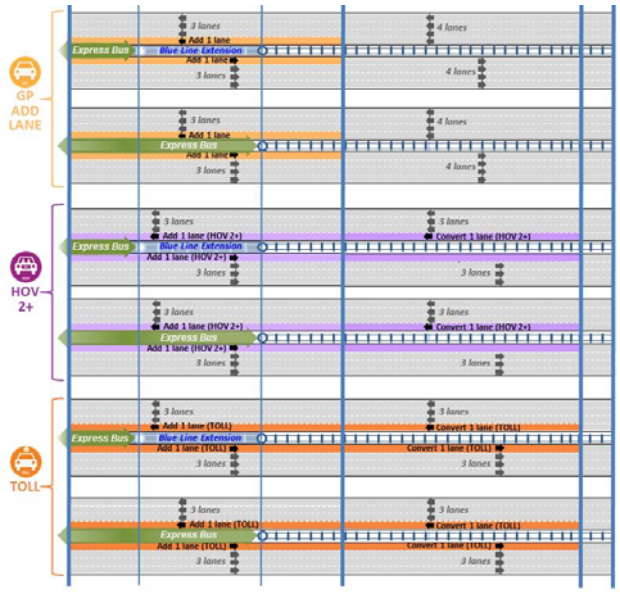
- 21 single mode alternatives identified
  - 9 Transit: 3 HRT, 5 BRT, EXP
  - 11 Expressway: GP, 6 HOV, 2 HOT, 2 Toll
  - 1 Arterial Widening (with & without parking)

Round 1 Single Mode Findings



Transit
- No impact on I-290 congestion
- Increased transit access to jobs
- Ridership diverted from existing transit facilities

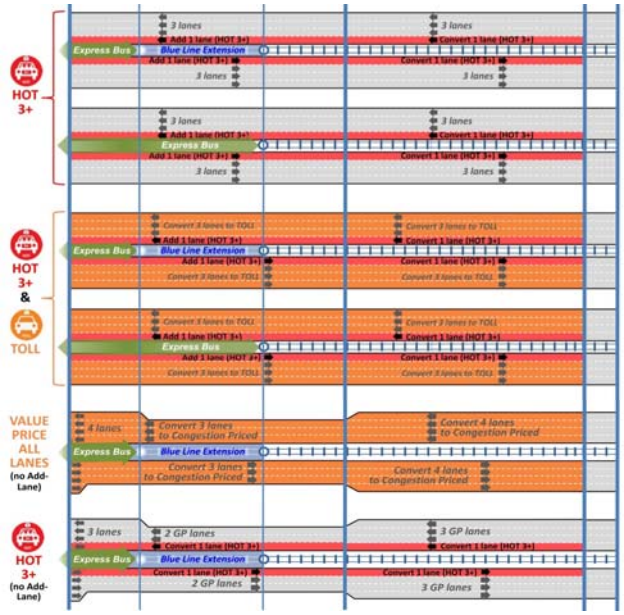
Expressway
- Best overall travel performance
- GP Lane: "under" manages flow (absorbs more demand)
- Tolling: "over" manages flow (arterial diversion)
- Managed Lane: more efficiently manages flow



Arterial Widening
- Fatally flawed due to displacement impacts

Opportunities to improve expressway performance by combining alternatives with transit

Round 2 - Combination Mode Alternatives + No Build

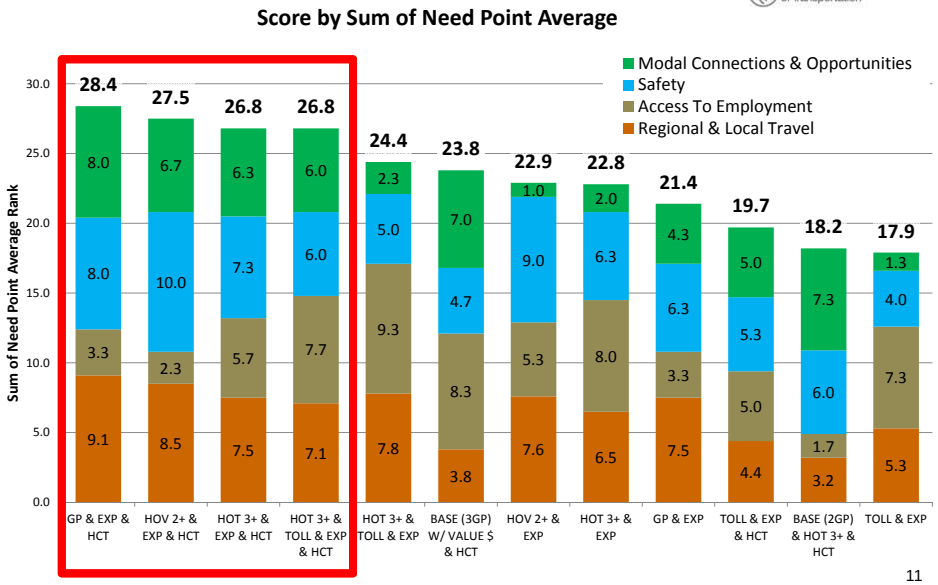


General Purpose Lane & EXP:
w & w/o HCT

HOV 2+ Lane & EXP:
w & w/o HCT

Toll Lane & EXP:
w & w/o HCT

Round 2 - Combination Mode Alternatives + No Build



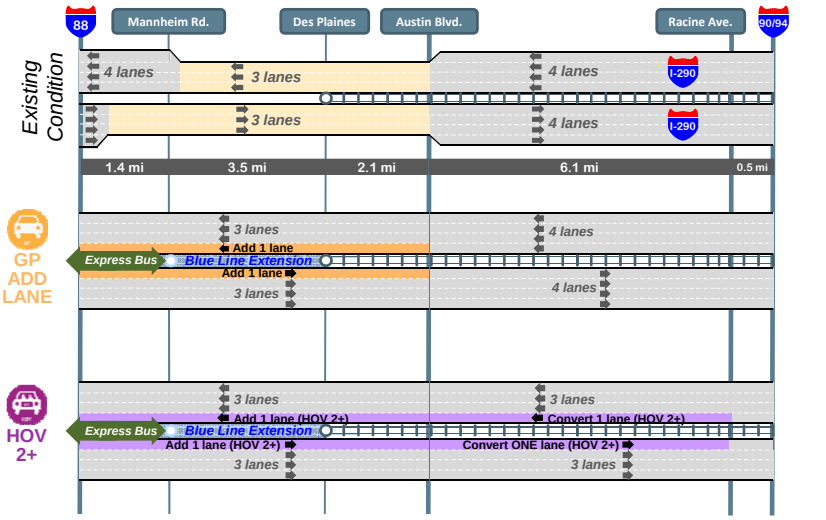
HOT 3+ Lane & EXP
w & w/o HCT

HOT 3+ Lane & TOLL & EXP
w & w/o HCT

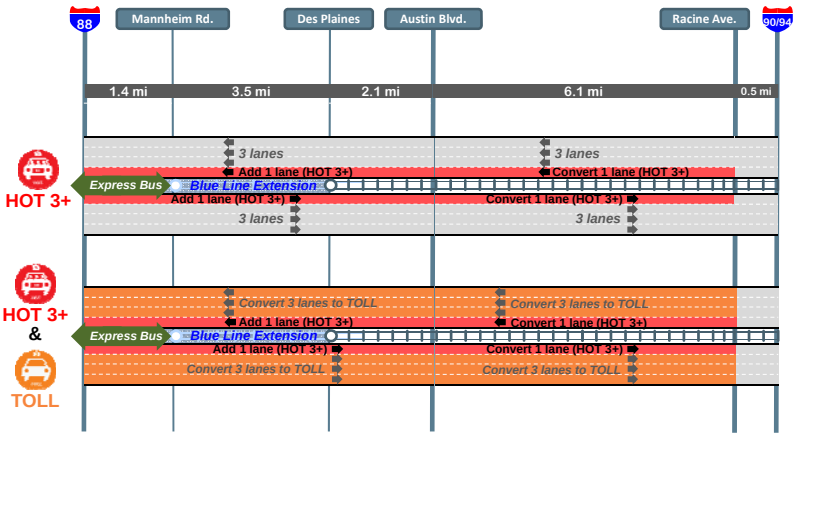
Value Price & EXP
w HCT *(no additional lanes)*

HOT 3+ Lane & EXP
w HCT *(no additional lanes)*

Round 2 Combination Alternatives Scoring Results



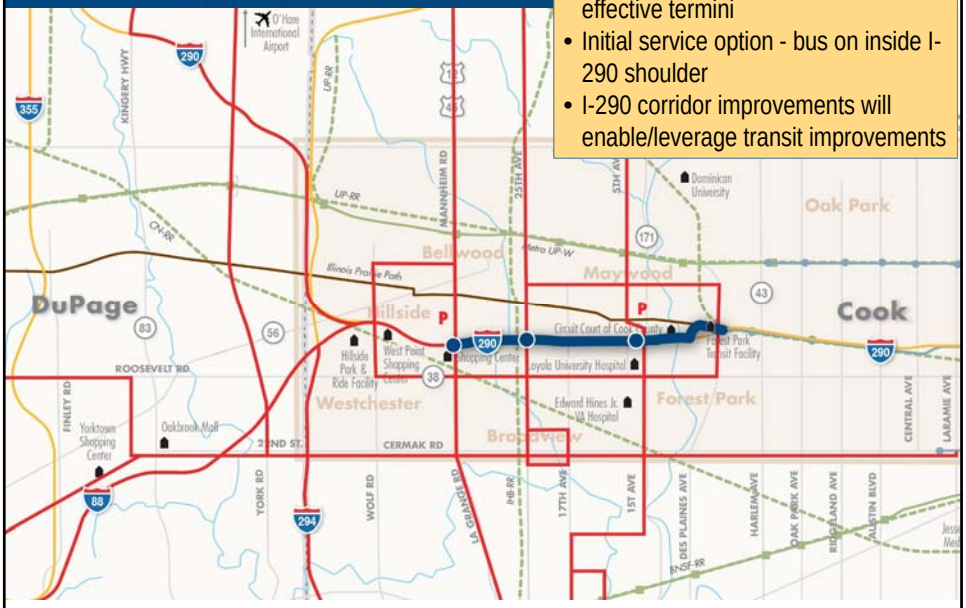
Round 2 Overall Conclusions



- Non-widening options performed poorly
- Adding a GP Lane attracts the **most traffic** to I-290
- Adding a HOV or HOT Lane provides **highest person throughput** in the corridor
- Tolling makes I-290 less attractive resulting in **auto diversion to arterials**
- HOV or HOT Lane provide **net improvements** in GP lane travel times

4 Combination Mode Alternatives Carried Forward
best meet Purpose & Need

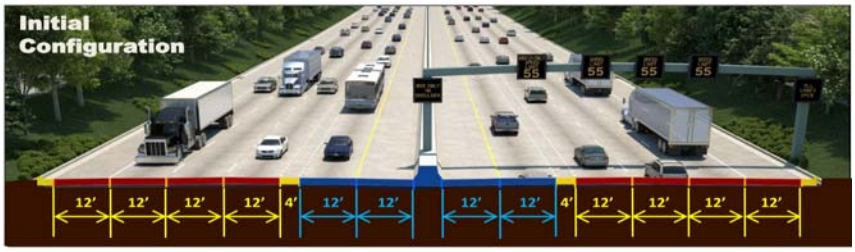
Round 3 - DEIS Alternatives



Round 3 - DEIS Alternatives

Blue Line Extension

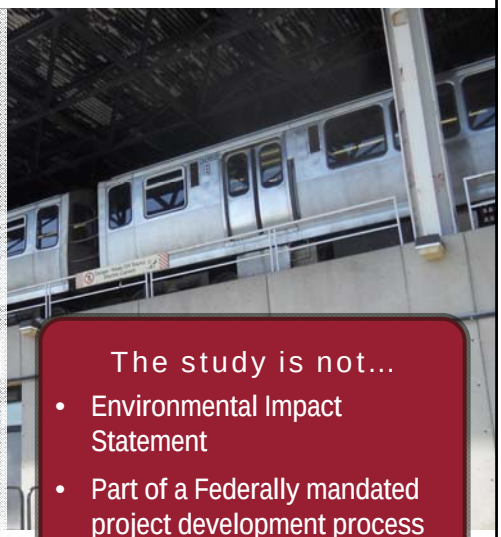
- Common to all alternatives
- Extension to Mannheim – most effective termini
- Initial service option - bus on inside I-290 shoulder
- I-290 corridor improvements will enable/leverage transit improvements



15

Convertible Transit Configuration

Illinois Department of Transportation



16

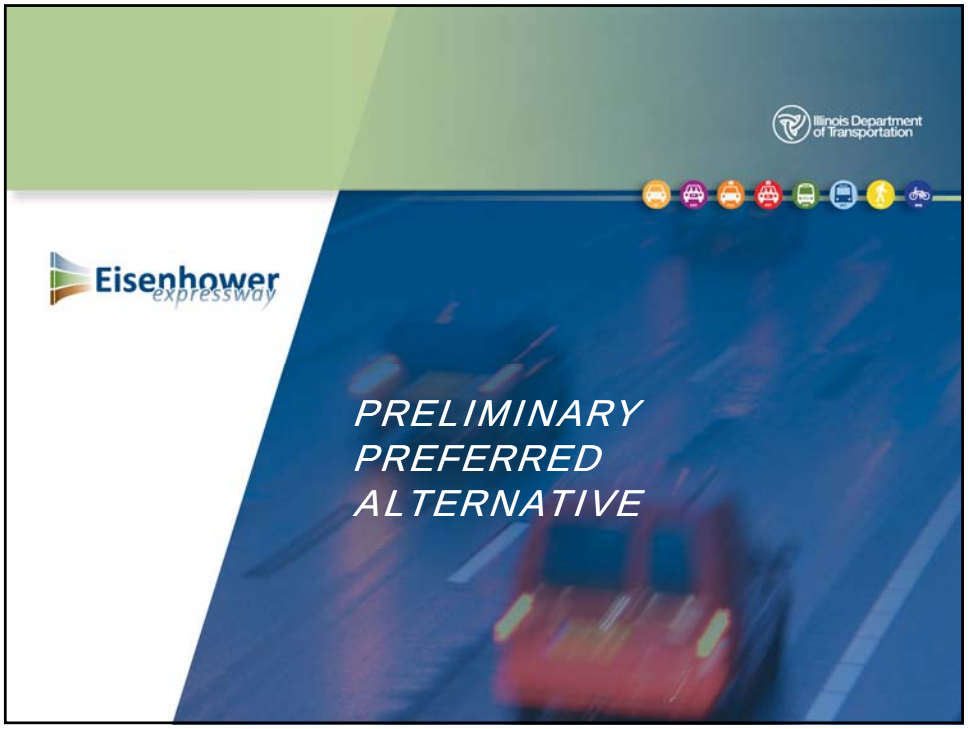
CTA Blue Line Forest Park Branch Feasibility/ Vision Study

CTA BLUE LINE VISION STUDY

- Opportunity to assess current conditions
  - Modernization needs exist for rail infrastructure and customer amenities
- Planning for modernization
  - Near-term (10 years)
  - Long-term (2040)
- Early outreach and comment opportunity for project stakeholders
- Recommendations will inform IDOT's I-290 Phase 1 Study

The study is not…

- Environmental Impact Statement
- Part of a Federally mandated project development process



17

Vision Study Preliminary Findings

CTA BLUE LINE VISION STUDY

- CTA focus on modernization of existing facility – not planning for an extension at this time.
- Third express track not needed
  - Potential express service – limited time savings
  - Insufficient ROW to add third track and 24' wide platforms in trench
- Forest Park Terminal Modernization
  - Evaluating site for new terminal/yard/shop
  - Improved access to terminal bus/auto/pedestrians
- Recommendations to improve stations
  - Wider platforms
  - ADA accessibility
  - Improved weather and noise protection

18

Travel Performance

Resource	Analysis Level	No Build Alternative	Build Alternatives			
			GP Add Lane	HOV 2+	HOT 3+	HOT 3+ & TOLL
Regional VMT (miles)	Quantitative	201,187,710	+151,380	+72,492	+52,211	+33,774

		Ratio Score (0 to 100)		498	891	**1123**	915

- HOT 3+ Alternative is highest ranked by both rank & ratio scoring

32

Build Alternatives Comparison

- HOT 3+ Alternative has highest score by rank or ratio method

33

How Does the Preliminary Preferred Alternative Address Stakeholder Goals?

- Congestion:
  - 56% travel time savings and improved reliability in HOT 3+ lane
  - Arterial relief
- Safety:
  - -6.2% overall expressway, arterial, and transit safety improvement
  - Improved non-motorized safety
- Facility Design:
  - Improved community connections across I-290
  - Improved access to transit
- Minimize or Avoid Impacts:
  - Mainline remains in existing ROW
  - Some ROW (2.4 acres) at spot locations near interchanges
- Additional Travel Choices:
  - Managed lane for 3+ person carpools, congestion priced tolling, and express bus service
  - New east-west multi-use trail

34

Recommendation for Preliminary Preferred Alternative

- Travel performance: HOT 3+ has highest score & ranks in top 2 in all travel performance categories
- Generally, no substantial environmental differences among build alternatives
- Recommend HOT 3+ & HCT & EXP Alternative as Preliminary Preferred Alternative

35

I-290 Next Steps

- CAG 21 Meeting: *October 15*
- CAG 22 Meeting: *February 2016*
- Draft EIS release: *February 2016*
- Public Hearing: *March 2016*
- Final EIS/ROD: *Fall 2016*

36

Illinois NEPA/404 Merger Meeting
September 17, 2015

USEPA – Region 5
77 West Jackson Blvd.
Chicago, IL

12th Floor – Lake Ontario Room

Federal Highway Administration
3250 Executive Park Drive
Springfield, IL 62703
Training Room

9 am – 12 noon

- I-55 Managed Lanes (District 1, Cook County) (45 min)
  - Request to exempt project from NEPA-404 merger process

- US 30 roadway improvements from Dugan to Municipal (District 1, Kane County, FAA Co-Lead) (45 min)
  - Request to exempt project from NEPA-404 merger process

- North Lake Shore Drive (District 1, Cook County) (90 min)
  - Information – project update

12 noon – 1:30 pm

Lunch

1:30 pm – 3:30 pm

- Interchange study at I-88 and IL 47 (District 1, Kane County) (60 min)
  - Information – project introduction

Note: the following project is not subject to the NEPA-404 merger process concurrence points and is being presented for information only.

- I-290 from west of Mannheim Road to Racine Avenue (District 1, Cook County) (60 min)
  - Information – preferred alternative

NEPA/404 Merger Meeting Summary
September 17, 2015

IDOT District 1, DuPage and Cook counties
I-55 Managed Lanes from I-355 to I-90/94
Environmental Assessment
Request for exemption from the NEPA-404 merger process

DECISIONS:

The following agencies agreed to exempt the project from the merger process: USEPA, USFWS, USACE, IDNR and IEPA

The following agencies were not present: IEPA and IHPA

NEXT STEPS:

None.

DISCUSSION:

This was the first presentation for the I-55 Managed Lanes project from I-355 to I-90/94. The purpose of the meeting was to provide a project overview and to request exemption of the project from the NEPA-404 merger process. Federal Highway Administration (FHWA) facilitated the meeting and prompted self-introductions. The Illinois Department of Transportation (IDOT) presented the project.

An overview of the project was presented by IDOT facilitated by a PowerPoint presentation and with reference to the project Environmental Resource Exhibit that was displayed. Project length, typical abutting land use, interchanges, traffic demand, vehicle occupancy, truck demand, corridor transit availability and congestion levels were reviewed. The existing roadway is in good physical condition and is not in need of reconstruction. The future travel demand within the study area is projected to be substantial due to anticipated growth in the Will County area. The intent of the project is to provide additional capacity within the existing median (generally forty feet wide along the south half of the project and sixty feet wide along the north half of the project). As such, no ROW acquisition is anticipated. Additionally, an active traffic management system is anticipated to provide additional travel management strategies for all lanes of the roadway.

In response to a question from USEPA, IDOT noted that the I-55 corridor will not likely need additional major reconstruction/rehabilitation for 25 to 30 years after this improvement is implemented.

DRAFT

The project Purpose and Need was reviewed. The needs include serving the corridor traffic profile; addressing travel demands; providing travel reliability and supporting transit opportunities. The purpose of the project is to promote mobility and operational efficiency; utilize congestion management strategies to improve reliability; provide a sustainable transportation solution; support new travel options and maximize the use of the existing facility.

The sketch level evaluation was summarized. Numerous alternatives were evaluated for the 2040 Design Year. The addition of a new general purpose lane did not provide travel reliability nor support transit opportunities and therefore was not carried forward. A truck only managed lane alternative would require an expanded roadway section requiring extensive reconstruction and ROW and therefore was not carried forward. Managed lane options evaluated included High Occupancy Vehicle (HOV) lanes, High Occupancy Vehicle Toll lanes (HOT) and Express Toll lanes (ETL). Managed lane alternatives in general support the need for improved mobility and sustainable solutions while supporting expanded transit opportunities.

The environmental impacts were reviewed. The project is anticipated to be constructed within the existing I-55 right-of-way, with only minor potential excursions outside of the existing right-of-way for drainage outfall improvements and potential spot locations for noise walls and/or ITS infrastructure. Environmental resource impacts will be generally limited to the existing grass median (60 foot) areas (east of Harlem Avenue – IL 43) where there are some areas identified as wetlands and Waters of the US requiring coordination with USACE. There may be minor additional impacts within existing interchange areas or near existing drainage outfalls for drainage improvements, and between the mainline and frontage roads or near the existing ROW line for noise abatement walls and/or ITS infrastructure improvements. Based on INHS field surveys, no threatened or endangered species or suitable habitat exists in the project area. Two historic resources exist within the project area (the Chicago Sanitary and Ship Canal historic district and the Harlem Avenue (IL 43) bridge over the canal) which will not be impacted by the proposed improvement.

In response to questions by USACE, IDOT confirmed that all the alternatives are within the same footprint and would be built in the existing median. Thus the environmental impacts of all the build alternatives will be similar. Although the proposed drainage plan is still in development, any required detention will be contained within the existing I-55 interchanges or by in-line pipe detention.

IDOT asked USACE for guidance regarding jurisdictional determinations for Waters of the US and specifically concerning how highway ditches are defined. USACE stated the new guidance that has been issued will result in little or no change on how jurisdictional determinations are made.

DRAFT

IDOT District 1, Kane County
US 30 Roadway improvements from Dugan to Municipal
Environmental Assessment
Request to exempt from NEPA-404 merger process

DECISIONS:

An exemption from the NEPA 404 merger process cannot be granted at this time. The difference in impacts between the two alternatives is too great. Additional information is needed on how FAA determines what alternative will be approved.

NEXT STEPS:

IDOT will coordinate with the FAA and resource agencies on their receptiveness to attend an off cycle NEPA meeting to discuss FAA position on project alternatives. IDOT will submit the alternatives analysis to FAA for review and concurrence on the preferred alternative. This requires review by FAA headquarters in Washington D.C.

DISCUSSION:

This was the first presentation of the project to the NEPA 404 merger agencies. The purpose of this meeting was to introduce the project and request exemption from the NEPA 404 merger process. The reason the project is being presented is that an individual permit will be required due to wetland impacts exceeding one acre and recent coordination with the FAA has resulted in the decision for the project to be processed as a condensed EA in accordance with FAA requirements with the FAA as a joint lead agency. The basis for the request for exemption from the NEPA 404 process is that the requirement to process as an EA is due to property acquisition from the local airport and not for environmental reasons. Also, the need for an individual wetland permit will afford the resource agencies the opportunity to review the project.

The meeting was led by Ted Hamilton, Project Manager for the project consultant, HR Green, Inc.

The project consultant (Hamilton) introduced the project. IDOT initiated the project in the Fall of 2013. The intent of the improvement is to address transportation related safety, capacity, and drainage issues. The project was approved by FHWA to be processed as a Categorical Exclusion II.

This section of US 30 is located in the Village of Sugar Grove, Kane County. US 30 provides direct access to IL 56/I-88 to the east and is utilized by traffic from communities located to the west and southwest. The Aurora Municipal Airport is located along the north border of US 30 within the project limits. A new residential development is located to the east and a mix of

DRAFT

commercial and industrial parcels is to the west. The Aurora Municipal Airport owns property south of US 30 that is currently used for agriculture.

The identified needs can be divided in four categories:

1. Improve roadway safety –

   US 30 was identified as a 5% location for Year 2010. A total of 55 crashes have occurred within the project limits from 2009 through 2013, with 27 total injuries, 5 of which were Type A or incapacitating injuries.

2. Address Traffic Issues / Expand Roadway Capacity –

   Traffic is projected to double by the year 2040 from 13,300 to 27,000 vehicles per day. Maintaining the existing two lane section for 2040 traffic results in insufficient roadway capacity, decreased safety due to congestion, and deficient levels of service.

3. Correct Existing Geometric Design Deficiencies –

   There are sight distance concerns due to a crest vertical curve located at the airport entrance, insufficient turn lane storage capacity at the intersection of US 30 and Dugan Road and lack of pedestrian / bicyclist facilities.

4. Provide Drainage Improvements –

   Flooding along the US 30 corridor with overtopping the roadway in a 50-year storm event. Because of the drainage issues the airport experiences operational problems with their MALSR equipment (Medium Intensity Approach Lighting System with Runway Alignment Indicator Lights). An advanced project is currently under construction to provide intersection and shoulder improvements along US 30 from Dugan Road to Municipal Drive. Included in this improvement is replacement of box culverts at two crossings to provide conveyance of a 50-year storm; however, the drainage improvements will not provide the required three feet roadway freeboard. The profile of US 30 needs to be raised approximately three feet to achieve the required freeboard.

The proposed improvement provides a four-lane roadway with a median and HMA shoulders. An open ditch drainage system is proposed except along the businesses east of Dugan Road. This section will utilize a closed storm sewer system to minimize property impacts. Profile adjustments are proposed along US 30 to meet freeboard requirements which will improve drainage, and to improve sight distance. A multi-use path is proposed south of US 30 throughout the project limits. The project was originally qualified and approved for processing as a Categorical Exclusion II. All wetland permits and mitigation requirements are to be followed, including agency coordination through the Section 404 permit process. Based on the anticipated wetland impacts at this stage of the evaluation, the permit will be processed as an Individual Permit.

DRAFT

Since the improvement required land acquisition of airport property, a meeting was held with the FAA to review the project. The resultant key points from the meeting were the following:

- Acquisition of property will be permanent easement rather than Fee Simple Acquisition.
- FAA requested to be a Joint Lead Agency.
- The project must meet FAA NEPA requirements.
- Existing US 30 crosses the runway protection zone (RPZ) of two runways.

FAA NEPA requirements (FAA Order 1050.1E.CHG1) specify if airport property is required and there is a change in land use, the project does not qualify as a Categorical Exclusion. The project is required to be processed as an EA utilizing their Condensed EA form. In addition, since the proposed alignment crosses the RPZ an alternative analysis is required. FAA Technical Memorandum – Interim Guidance on Land Uses Within the RPZ, September 2012, specifies a full range of alternatives be identified and documented that will avoid the RPZ, minimize impacts, and mitigate risk.

There are multiple project constraints in developing different alternatives:

- Aurora Municipal Airport – The location of the airport, the two RPZ's, and the MALSR which extends south of US 30.
- The Burlington Northern & Santa Fe (BNSF) Railroad is located south of the RPZ.
- Current Construction Projects –continuity with adjacent projects, including to tie into the intersection improvements at US 30 and Dugan Road that are currently being constructed. Just south of the intersection is an additional intersection improvement along Dugan Road at Granart Road which has recently been constructed.
- There are numerous environmental resources including wetlands, floodplain, prime farmland, and water resources.
- Existing improvements at Municipal Drive and an existing residential development along Municipal Drive south of US 30.

Five alternatives have been considered. From coordination with the FAA and the Aurora Municipal Airport, three of five developed alternatives are being considered for further analysis. Alternative 1 shifts the US 30 alignment approximately 140 feet south to avoid the MALSR. This alternative does avoid the smaller of the two RPZs. Alternative 2 shifts the alignment to avoid both RPZs. Due to the location of the BNSF railroad, the alignment consists of minimum radius curves with maximum superelevation. The third alternative is the no build option which will not address the safety and operational concerns that currently exist while maintaining existing US 30 within both RPZs. The remaining two alternatives were eliminated due to maintenance issues identified by FAA related to the MALSR.

A comparison table of impacts for Alternative 1 and Alternative 2 was presented. The two alternatives were compared for environmental impacts, safety concerns, right of way impacts, and community/economic impacts. Alternative 1 is considered safer since the alignment consists of gentle curves rather than the sharp curves of Alternative 2. Alternative 2 requires twice the

DRAFT

amount of land acquisition, severs parcels, and has greater wetland impacts. Shown below are the environmental impacts.

Environmental Impacts	Alternative 1	Alternative 2
Wetlands	2.0 Acres	6.2 Acres (0.9 High Quality)
Floodplains	6.9 Acres	11.4 Acres
Stormwater Detention	1.45 Ac/Ft	1.99 Ac/Ft
Cultural	None	None
Biological	None	TBD*
Water Quality	Minor	Greater
Permitting-ACOE 404	Required (IP)	Required (IP)
Noise		
--No. Impacted	1	1
--Noise walls likely to be implemented	No	No
--Maximum noise level increase	5 dB(A)	12 dB(A)

*Based upon best available information, pending completion of Wetland Delineation Report

Mr. Hamilton then concluded his presentation with reasons IDOT seeks exemption from the NEPA 404 Merger Process:

- IDOT/FHWA view would normally process the project as a categorical exclusion.
- IDOT/FHWA is processing as an EA for so that FAA can use our environmental document for their decision making process.
- FAA requires EA due to property acquisition with change in use.
- Project length is approximately 1.9 miles on a defined corridor with physical barriers; airport to the north and BNSF RR to the south, constraining the project study area.
- FAA request to be joint lead will impact project schedule.
- Only a limited number of reasonable alternatives exist.
- NEPA requirement of avoidance, minimization and mitigation of resources still applies.
- A Section 404 Individual Permit is anticipated regardless of alternative selected, providing sufficient opportunity for agency involvement and input.

USFWS (Cirton) asked if all the wetlands been field identified. The wetlands located north of US 30, 500 feet south of US 30 and along with the Sugar Grove Branch were delineated. Information for the wetlands located north of the BSNF railroad and adjacent to Municipal Drive

DRAFT

is based upon ADID maps. Additional information is pending upon the completion of the Wetland Delineation Report by the IHNS.

USEPA (Westlake) inquired if FAA had concerns with birds being drawn to the proposed basins. The basins are designed to FAA standards and will drain within 48 hours of a storm event.

USACE (Hall) suggested verifying the area of wetland impact for Alternative 1 within the floodplain. If only the banks are impacted the total acreage may be less than 1 acre which would not require IP permitting. Another alternative to consider is tunneling the road under the RPZ. USEPA (Westlake) and USFWS (Cirton) stated that this could substantially increase the cost of the project and cause stormwater management issues since this area has a history of flooding.

FHWA (Piland) inquired what type of FAA rules/policy dictates the avoidance of the RPZ. Are these laws or just guidelines? IDOT is meeting with the FAA in the near future and will request this information.

USACE (Hall) stated he cannot make a determination for exemption to the NEPA 404 Merger Process. There is too much uncertainty on how the FAA will proceed with the alternatives. USEPA agreed that additional information is needed to make a determination. IDOT stated that the FAA was invited to attend this meeting.

FHWA (Fuller) asked if the attendees would be willing to meet off cycle to discuss this further with the FAA since this project is a district priority. All agencies were willing to meet off cycle.

DRAFT

IDOT District 1, Cook County
US 41 (North Lake Shore Drive) – Grand Avenue to Hollywood Avenue
Environmental Impact Statement
Information – Project Update

DECISIONS:

Additional permitting is not required for lake fill within a harbor.

NEXT STEPS:

The project consultant will continue developing a range of alternatives and documenting the environmental resources.

DISCUSSION:

This was the sixth presentation of the project to the NEPA/404 merger team. The purpose of this meeting was to provide a project status as well as provide a presentation regarding shoreline protection and lake fill.

The meeting was led by Mary Young (Young) of Civiltech Engineering, the project consultant, with Mike Folkening of Civiltech Engineering and Lars Barber of Baird & Associates also presenting.

The project consultant (Young) provided a project update since the last NEPA-404 merger meeting in September 2014. The purpose and need statement was approved in December 2014. The purpose of the project is to improve the NLSD multi-modal transportation facility. The specific needs to be addressed throughout the study include: improve safety, improve mobility of buses, automobiles and non-motorized modes of travel, improve facility deficiencies, and improve accessibility to and from Lincoln Park, the Lakefront Trail and the adjacent communities. Identified needs can be divided into four categories:

- Improve Safety for All Users
- Improve Mobility for All Users
- Address Infrastructure Deficiencies
- Improve Access and Circulation

On October 15, 2014 the NLSD project team conducted its 3rd field trip. The primary focus was to observe the environmental resources including impacts to beaches and the historic nature of the park. Although not in the study area, a tour of Northerly Island was conducted. Northerly Island is a 91 acre peninsula providing paths, casual play areas, and fishing. The project restored the shoreline habitats, coastal wetland and other coastal plant communities and installed native

DRAFT

plants and trees. The project created a high quality and more diverse natural area for flora and fauna.

Additionally, the team visited the Montrose Point Illinois Natural Areas Inventory (INAI) site along with the Magic Hedge bird sanctuary. There are several sections of NLSD where the corridor is constrained, either by the urban edge, shoreline, park amenities, or other sensitive areas such as bird sanctuaries. The NLSD project study corridor contains two bird sanctuaries, one located just north of Belmont Harbor, and the other, the Magic Hedge, located along the eastern side of Montrose peninsula. At the Magic Hedge, over 300 species of birds have been recorded. A small stretch of low-lying bushes and the west side of the sanctuary in particular have been a magnet for migrating songbirds and rarities. In 2005, Montrose Beach Dunes was added to the Illinois Department of Natural Resources' statewide list of high-quality natural areas (Illinois Natural Areas Inventory).

The project consultant (Folkening) presented on the 2015 field visit, held on August 13, 2015. The focus of this field visit was to witness the peak summertime activities within the corridor including: traveling on the CTA bus routes along the corridor, bicycling along the existing multi-use paths through Lincoln Park, visiting active construction sites for Navy Pier Flyover and Fullerton Parkway Revetment/Theater on the Lake project, and viewing previously implemented improvements along South Lake Shore Drive.

The field trip attendees split into 2 groups to ride CTA buses: Routes #135 (Outer Drive from Belmont Avenue to Grand Avenue) and #147(Outer Drive from Foster Avenue to Michigan Avenue Although traffic was down due to the summer, both buses were filled to capacity.

An on-site presentation was then provided of the Navy Pier Flyover construction which was designed to provide safer walking and biking along the Lakefront Trail near Navy Pier. This section of the Lakefront Trail is one of the most heavily traveled in downtown Chicago. The Flyover provides an elevated path from the Chicago River to Jane Addams Park which will grade separate the Trail from Illinois and Grand Avenues. The bi-directional Flyover pathway is 16 feet wide. Funding is primarily provided by CMAQ with additional funds made available by the State of Illinois. The total cost is $60 Million, split over three phases. Once the construction is complete, the Chicago Park District will assume maintenance responsibilities.

The tour then shifted to the construction activities at the Fullerton Parkway Revetment - Theater on the Lake project. This project is the last in a series of shoreline improvements that stemmed from the Chicago Shoreline Protection Project. The new revetment will stretch for 1,700 feet and protect the area against flooding and erosion. The site is also one of the worst bottlenecks of congestion for pedestrians, bicyclists, and runners. The improvement will straighten out the severe curve at this location along the Lakefront Trail.

The tour then traveled to South Lake Shore Drive to see improvements that were constructed as part of that project which had challenges and opportunities similar to the North Lake Shore Drive Project.

DRAFT

In September 2015, the Project Study Group traveled to Minneapolis, MN to observe Bus on Shoulder (BOS) operations. The Twin Cities region has more than 300 miles of freeway shoulder available to buses, which is more than three times the number of all metro areas in the country combined. The group witnessed BOS operations in the AM & PM peak hours, attended a tour of Minneapolis's Transit Control Center and met with Metro Transit's operations and planning experts.

The project consultant is continuing studies including documenting environmental resources and developing a range of alternatives.

The project consultant (Barber) from Baird & Associates presented coastal considerations for the NLSD project. For NLSD, the project team will perform coastal analysis and may need to construct shore protection systems in areas that do not have adequate shoreline protection. These protection systems will consider wave overtopping and flooding in conjunction with alternatives developed by the project team. Photos of overtopping and flooding from the 1950's, 1987, 2011, and the recent October 31, 2014 event were presented, conveying the need to address flooding along NLSD which has been a problem for a very long time.

For the NLSD project, site investigations and existing condition analysis was performed for the shoreline section from Grand Avenue to North Avenue. The existing data includes water depths, beach profiles, and grain sizes.

A cross section at Banks Street was presented to illustrate how a stepped concrete revetment accommodates overtopping and flooding. The stepped revetment extends farther out into deeper waters. It was noted that waves have the ability to rise upwards of 65% off the available water depth. Some of the wave is below the still water, but most of the wave height is above. It was noted that the high water elevation for a 100 year event at the Banks Street location has an approximate datum of +7 feet. Mr. Barber discussed the stepped stone revetment for the shoreline section between Fullerton Parkway and Diversey Avenue. This section has a ponding area available for storage. The low water condition was compared to the October 31, 2014 event. The Diversey Avenue-Fullerton Parkway section allows the back wave to travel back out to the lake. This berm section is at elevation +12 feet, with an additional berm towards the back that is 2 feet higher. The storage width for this segment is approximately 150 feet. For the NLSD project, the project team will need to carefully evaluate crest elevations, setbacks, overtopping and return rates, especially in regard to alternatives that include depressing segments of NLSD or sections involving causeways or bridges.

USACE (Hall) asked if the design for the water level factors in permanent changes that lower the water level. The project team stated that several water levels are used during analysis. Each case has a specific feature which determines the worst case scenario.

USFWS (Cirton) suggested that the parkland be mitigated in kind and habitats in kind. Near shore habitats for fish should be considered with the improvement of the shoreline protection. The lake fill should incorporate wildlife habitats. The project team stated that recycled materials can be used to provide habitat oriented fill.

DRAFT

USACE (Hall) stated that coordination with the USACE should take place for the existing projects. The coordination should include Section 408 authorization and potential impacts with work already completed. The project team stated that coordination will take place and that the majority of the potential impacts are in locations that have not been improved.

CDOT (Sadler) asked if there was anything unique, such as additional permitting, to consider about filled harbors versus open shoreline. USACE stated that all lake fill and dredging requires the same USACE involvement. No additional permitting is required.

ILEPA (Faught) emailed after the meeting stating that there was phone trouble and wanted to bring up stormwater management which should be considered when evaluating alternatives for North Lake Shore Drive. If the ILEPA is required to conduct a water quality review (i.e. for an individual 401 water quality certification or Section 39 final determination for an IDNR Lake Michigan Permit), water quality impacts including issues with impairments will be studied. There are currently some Total Maximum Daily Loads (TMDLs) for Lake Michigan due to impairments. He noted that more information can be found on the IEPA TMDL page here: http://www.epa.illinois.gov/topics/water-quality/watershed-management/tmdls/reports/index

The ILEPA noted that the TMDLs should be complied to determine if there are any new stormwater discharges to Lake Michigan (i.e. stormwater from areas that did not previously drain to the Lake) and that "new" water is not discharged in one of the areas subject to the TMDLs. Since the project is in the planning stages, it is not possible to say what requirements the ILEPA would have, however, it may be as simple as adding a BMP treatment system. The easiest thing for ILEPA's review would be to make sure that the drainage patterns to the Lake are not changed. As planning becomes more finalized and if there is a need to re-route water to the Lake, it is suggested that coordination with the ILEPA occur to discuss where the "new" drainage will occur and what we may be needed to assure the TMDLs are in compliance.

DRAFT

IDOT District 1, Kane County
Interchange study at I-88 and IL-47
Environmental Assessment
Information – Project introduction

DECISIONS:

None requested, none given.

NEXT STEPS:

Seek concurrence on the project's Purpose and Need at the February 2016 NEPA/404 Merger Meeting.

DISCUSSION:

This was the first presentation of the I-88 at IL 47 interchange project. The purpose of the meeting was to introduce and provide an overview of the project. The Federal Highway Administration (FHWA) facilitated the meeting and prompted self-introductions. The Illinois Department of Transportation (IDOT) presented the project which was facilitated with a PowerPoint presentation.

The Project Study Group (PSG) includes IDOT, Illinois Tollway, Kane County, the FHWA, and the Village of Sugar Grove who is the lead agency

The project location and past studies were discussed. The project study limits run along IL 47 from Old Oaks Road/College Drive on the south to Green Street on the north, and a half a mile east and west of IL 47 on I-88. The existing I-88 at IL 47 provides partial access to-and-from the west only. IL 47 consists of a four lane cross section (two lanes in each direction) between Finley Road and Seavey Road with a northbound left-turn lane at the existing westbound I-88 entrance ramp. North and south of the interchange, IL 47 consists of a two lane cross section (one lane in each direction) between Old Oaks Road/College Drive to Finley Road, and from Seavey Road to Green Street.

The existing land use in the study area consists of agricultural (58%), residential (26%), forest preserve (15%), and institutional (1%). The Village of Sugar Grove's future land use plans for this corridor anticipate development including commercial and corporate campus land uses. Based on population growth information provided by the Chicago Metropolitan Agency for Planning (CMAP), the Villages of Sugar Grove and Elburn are expected to experience 30% growth by year 2040. Existing population of Sugar Grove and Elburn are expected to grow from 10,000 to 30,000 and 6,000 to 18,000 respectively.

DRAFT

Similarly, traffic volumes along IL 47 are expected to grow 36% south and 60% north of I-88 by year 2040 maintaining the existing partial access interchange and assuming no improvements to IL 47 or a "No-Build" condition. The existing Average Daily Traffic (ADT) volumes along IL 47 range from 7,400 to 10,900 vehicles per day (vpd) and are expected to grow to 12,000 to 15,000 vpd by year 2040 in a "No-Build" condition. Traffic volumes along I-88 currently range from 28,000 east of IL 47 and 31,000 west of IL 47 and expected to experience 10% growth by year 2040.

A summary was then provided of the first Public Meeting that was held on July 29, 2015. The meeting was attending by 103 people who submitted a total of 17 comment forms. Issues raised by the public at that meeting included: safety concerns/suggestions, concerns regarding noise and water pollution, land use suggestions, access suggestions, and alternative roadway configurations.

The first Community Advisory Group (CAG) meeting, held September 1, 2015, was then summarized. The meeting was attended by 21 CAG members. The concerns that were raised at that meeting included: drainage, environmental impacts, accessibility, safety, capacity, other infrastructure, and funding. The second CAG meeting is anticipated to be held in November 2015, to discuss the draft Purpose and Need for the project.

IDOT provided an overview of the initial outline of the Purpose and Need based on the initial data collected and stakeholder comments. Population and transportation demands in the area were reviewed and crash statistics were summarized. Purpose and Need Items discussed included: Enhance System Linkage and Accessibility, Support Existing and Future Economic Development, Accommodate Transportation Demands, and Improve Safety.

The U.S. Environmental Protection Agency (USEPA) commented on the study location and if there are any addition access needs identified along I-88 corridor. IDOT will evaluate and incorporate additional information and justification into the Purpose and Need document to support the logical termini for this project.

IDOT provided an overview of environmental resources located with the study limits. The environmental resources that have been identified thus far include the Hannaford Woods/Nickels Farms Forest Preserve property located along both sides of IL 47 south of the interchange and just north of Waubonsee Community College. Blackberry Creek and Tributary C to Blackberry Creek are also located within the project study limits. Information regarding other natural and cultural resources is still being collected at this time.

Based on the safety and crash data presented by IDOT, the U.S. Army Corps of Engineers (USACE) expressed concern as to whether there was adequate data to justify safety as a need for this project. IDOT indicated that the study team will evaluate further.

The USACE suggested the purpose and need document contain an exhibit showing the operation Level of Service (LOS) for the existing and future "No-Build" traffic. IDOT indicated they will incorporate the subject exhibit into the Purpose and Need document.

DRAFT

IDOT District 1, Cook County
I-290 from west of Mannheim Road to Racine Avenue
Environmental Impact Statement
Information – Preferred Alternative

DECISIONS:

None requested, none given.

NEXT STEPS:

The draft EIS is expected to be release in February 2016.

DISCUSSION:

This was the sixth presentation of the I-290 project to the NEPA/404 Merger Team. The purpose of the meeting was to update the Merger Team on the status of the Study and present a preliminary preferred alternative recommendation that will be described in the Draft Environmental Impact Statement. It should be noted that at the September 9, 2009 meeting, the NEPA/404 Merger Team concluded that this project will not require formal concurrence, and that the project may continue as an EIS with agency review using the scheduled NEPA/404 merger team meetings to provide project updates.

IDOT Region 1 (IDOT) and the project consultant Parsons Brinckerhoff (PB) presented a PowerPoint presentation to the Merger Team. The presentation provided a brief summary of the study and concluded with a preliminary preferred alternative recommendation of the HOT 3+, High Capacity Transit Extension and Express Bus Alternative.

The IDOT presentation included:

- Study Area: West of US 12/20/45 (Mannheim Road) to Racine Avenue
- Study Process: Three rounds of alternatives evaluation and screening
- Public Involvement: Context Sensitive Solutions approach including Corridor Advisory Group, agency and small group meetings, public meetings and project website
- Purpose and Need: To improve regional and local travel, improve access to employment, improve safety for all users, improve modal connections and opportunities, and address facility deficiencies
- Round 1 Single Mode Screening: 570+ initial stakeholder suggestions were considered resulting in 21 single mode alternatives (9 transit, 11 expressway, and 1 arterial widening). The round 1 analysis showed that the transit alternatives had no impact on I-290 congestion, the expressway alternatives had best travel performance, and the arterial widening alternative was fatally flawed due to displacements.

DRAFT

- Round 2 Combination Mode Screening: Evaluated 12 combination mode alternatives including General Purpose (GP) lanes, high occupancy vehicle (HOV) 2+ persons per vehicle, toll all lanes, high occupancy toll (HOT) 3+ persons per vehicle, HOT 3+ and toll all remaining lanes, no widening and value price, no widening with HOT 3+ conversion. These alternatives all included express bus and were tested with and without high capacity transit (HCT). These alternatives were compared to the No Build Alternative using purpose and need evaluation measures and scoring, resulting in the No-Build, GP, HOV 2+, HOT 3+ and HOT 3+ and Toll Alternatives all with express bus and a HCT extension being carried forward for evaluation in the DEIS and Round 3 as shown in Attachment 1.
- Round 3 DEIS Alternatives: These four alternatives were further defined including interchange types, a typical cross-section to allow a future westward HCT extension, additional feeder bus service, and non-motorized improvements including wider sidewalks, improved ADA accessibility, and an east-west multi-use trail allowing a connection from the Illinois Prairie Path in Maywood to Columbus Park in Chicago (See Attachments 2 and 3 for transit components associated with alternatives).
- CTA Blue Line Vision Study: Planning study for modernization of the Blue Line Forest Park Branch and coordination with I-290 Phase I Study. Preliminary findings included focus on existing facility (not planning for an extension at this time), a third express track is not needed, Forest Park terminal station, yard and shop to be modernized, maintain current station entrances, and improve stations.
- Preliminary Preferred Alternative Recommendation: An evaluation matrix was presented including travel performance, as well as social, economic and environmental factors. HOT 3+ was the best overall in travel performance, ranking first or second in all other measures. There were no substantial environmental differences among the build alternatives since they all have the same footprint. Only 2.4 acres of new right-of-way will be required for a project with an approximate construction cost of $2.6 billion. Scoring matrices were presented showing the HOT 3+ as the highest scoring, and consistent with addressing stakeholder goals (See Attachments 4 and 5).
- Next Steps: DEIS release in February 2016, Public Hearing in March 2016, FEIS/ROD in late summer/fall 2016.

Agency questions and comments during and after the presentation included several questions from the USEPA including:

- When will the DEIS be released? IDOT responded that the release is currently anticipated in February 2016.
- What is HCT? IDOT responded it is High Capacity Transit, which represents a fixed guideway transit extension as either a Blue Line heavy rail extension or bus rapid transit.
- Has IDOT looked at other arterial improvements beyond the crossings? IDOT responded that they are reviewing potential improvements to parallel east-west arterials in advance of mainline construction, including North Avenue, Madison Street, Roosevelt Road, and Cermak Road in terms of ensuring good pavement surface, and operational improvements such as modernized, interconnected traffic signals, intersection monitoring with television cameras, and arterial dynamic message signs, among other improvements.
- With regards to environmental justice, have the impacts of tolling on low-income

DRAFT

populations been analyzed for the HOT 3+ Alternative? IDOT responded that carpools with three or more occupants and transit vehicles would not pay tolls to access the managed lane. In addition, potential remedial strategies could include toll subsidy programs for low-income families (Los Angeles), promotion of carpooling/vanpooling to employment centers from low-income areas, as well as national research showing support for HOT lanes by low-income populations. Also, the remaining general purpose lanes receive a benefit from the HOT 3+ in terms of improved travel times and decreased congestion for those motorists not paying tolls.

- Are there neighborhood concerns with the ramp consolidation? IDOT responded that there has been some concern expressed but not at a neighborhood level. It has been a few individuals. What is driving the design is the elevated crash rates on I-290 between 1st Avenue and 25th Avenue which is associated with the very close ramp spacing in this section. There have been a couple of instances where stakeholders have questioned the change in access, and access to a particular commercial establishment at 1st Avenue. IDOT has coordinated closely with Maywood, Bellwood, and Broadview on the change in access. Due to current design standards and the very close crossroad spacing, it is physically not possible to reinstate the existing 9th Avenue ramps and the 17th Avenue ramps to and from the west.

Removal of the ramps at 17th and 9th is expected to reduce the number of vehicles using the frontage roads as bypass routes to mainline congestion. This returns the frontage roads to the local communities and the residential neighborhoods on the either side of the expressway.

IDOT BDE said that a revised Section 25 of the BDE manual covering Environmental Impact Statements has been prepared. For the FEIS, two options are now described: a traditional FEIS, followed by a Record of Decision (ROD), and a combined FEIS and ROD. FHWA said that if a preliminary preferred alternative is presented in the DEIS, then by default, a combined FEIS/ROD document should be prepared.

1.0 Introduction

This document describes the procedures used to prepare the conceptual level cost estimate for the I-290 Preliminary Engineering and Environmental Study – West of US 45 (Mannheim Road) to Racine Avenue (I-290 Study). The estimates are intended to provide an indication of the magnitude of costs for the proposed project components in the Draft Environmental Impact Statement (DEIS), and to support the alternatives evaluation process.

2.0 Project Background

The Project Corridor begins at the intersection of I-290/I-88 to the west and traverses east through the Villages of Hillside, Bellwood, Westchester, Broadview, Maywood, Forest Park, Oak Park, and City of Chicago. Reconstruction is proposed for I-290 extending from the I-88/I-290 split in the west to approximately Kostner Avenue. This section is proposed to be completely reconstructed including mainline, interchanges, and multiple crossroads structures and is referred to as the *Reconstruction Section*. Restriping of the existing eight-lane section is proposed from east of Kostner Avenue to Racine Avenue with improvements dedicated to accommodating operational/managed lane features of the preferred alternative and is referred to as the *Restriping Section*. The extent of improvements from Kostner Avenue to Racine Avenue include pavement restriping and potential noise abatement wall placement. Existing overhead bridges in this section are proposed to be reconstructed as part of separate, stand-alone projects.

3.0 Methodology

The conceptual cost analysis began with a parametric estimate for major construction categories and refined with actual quantity breakdowns and takeoffs. Unit costs were determined and calibrated using similar projects based on order of magnitude, project location, and the nature of the overall project such as an urban environment with constrained right of way and high traffic volumes. High cost value construction categories are further subdivided increasing detail and accuracy for the overall conceptual cost estimate. Unit costs were adjusted and assessed for a base year of 2015. Inflation was applied as necessary to provide Year of Expenditure costs for the project analysis.

Example projects used for calibration include several Circle Interchange projects and the Illinois Tollway I-90 reconstruction. Both projects are located adjacent to or near the Project Corridor and are currently under construction.

3.1 FHWA Major Project Review

The Federal Highway Administration (FHWA) completed a "Major Project Review" of the proposed project in September 2015. The objective was to conduct an unbiased risk-based review to verify the accuracy and reasonableness of the current estimate and apply an independent risk based probability range for the cost estimate.

Based on the assumptions and risks discussed during the review, the cost estimate at the 70 percent confidence level is $2,630 million (year of expenditure). For the purposes of the review, the project was assumed to be completed in year 2027 at the 70 percent confidence level. The cost ranged between $2,080 million (0 percent) to $3,069 million (100 percent). These estimates are based on the best information available at the time they were developed. It is expected that cost estimates will be revised and refined through further project development, such as Phase 2 design and future procurement activities.

4.0 Major Construction Items and Unit Costs

The major construction items were identified as items with the greatest influence on the construction cost which can be reasonably defined at the preliminary level of design. Quantities for these major items were generated based on quantity takeoffs and historical project data. The major construction items are grouped into the following headings:

- Roadway Related Items,
- Structures (bridges and retaining walls),
- Land Acquisition, Right-of-Way and Land Remediation,
- Environmental Mitigation (noise walls),
- Engineering Services,
- Transit Related Costs, and
- Project Contingency.

4.1 Roadway Related Items

This category includes pay items related to demolition and removal, pavement, earthwork and grading, pedestrian improvements, roadside safety, traffic signals and signing, lighting, drainage, intelligent transportation system (ITS), tolling, utilities, traffic control, erosion control and landscaping, aesthetics, mobilization, and construction layout.

4.1.1 Demolition and Removal

Demolition and removal costs were estimated based on the conceptual design footprint. Existing bridge and sign structure demolition within the *Reconstruction Section* is included in this cost. Bridge demolition costs are broken down further by distinguishing between railroad bridges (CSX, CTA, and IHB Railroads), minor crossroad bridges, and bridges associated with a full interchange. Removal of existing pavement, curb and gutter, concrete barrier, guardrail and sidewalks are measured directly from existing topographic survey and individually quantified within this cost.

4.1.2 Pavement

The proposed project assumes multiple pavement designs based on roadway classifications. The cost estimate separated out the pavement design into three classifications based on past pavement designs by the Illinois Department of Transportation. The three classifications include mainline pavement, interchange ramps, and local roadways/frontage roadways. The mainline pavement and ramps costs are based on a durable rigid pavement (Jointed Concrete) with a hot mix asphalt base. Mainline and ramp shoulders costs are based on full depth concrete pavement construction. The same pavement design is used for both the mainline and ramps. The frontage/local roadway pavements are based on a standard flexible hot mix asphalt design. Pavement pricing may vary significantly depending on the final design and material selection. The design and pricing are based upon pavement life cycle for the project.

4.1.3 Earthwork and Grading

Roadway profiles and cross sections were developed for the proposed design. Estimated quantities for earth excavation and fill materials are based on quantity takeoffs and calculated per cubic yard. An estimated quantity of unsuitable material is included as part of the overall earthwork quantities. A special waste excavation quantity and cost is provided as part of the project based on a percentage of the overall earthwork cost.

4.1.4 Pedestrian Improvements

This cost is intended to cover project improvements for a multi-use path and pedestrian friendly improvements such as increased width sidewalks. Costs are generated based on historical data for projects of this magnitude and geographic location.

4.1.5 Roadside Safety

This cost covers the approximate cost and quantities of concrete median barrier and locations requiring guardrail protection and Jersey barrier wall associated with the proposed project.

4.1.6 Traffic Signals, Signing, and Pavement Markings

This cost is intended to cover the cost of proposed traffic signals, signing, and pavement markings. The cost for traffic signals are broken down into three general types of categories and applied throughout the project. The three categories for traffic signals

include a proposed cost for the Single-Point Urban Interchange at 25th Avenue and 1st Avenue interchanges, a cost for a Single-Point Urban Interchange for Harlem Avenue and Austin Boulevard interchanges, and cost for a standard urban local roadway intersection scenario. The proposed signing cost is intended to cover full replacement of sign panels and ground mounted posts throughout the project corridor and replacement of the existing truss and cantilever supports within the *Reconstruction Section* of the project. The signing cost is based on a percentage of the overall construction cost. The pavement markings cost is based on quantity takeoffs for the proposed pavement marking design for both the *Reconstruction* and *Restriping* sections.

4.1.7 Lighting

This cost category is intended to cover the cost of proposed lighting along the I-290 Eisenhower Expressway median, interchanges, and along local roadways as applicable. The cost assumes all existing lighting is replaced. The proposed lighting costs are generated using specific pay items and applied for each type of location mentioned above.

4.1.8 Drainage

This cost is intended to cover all temporary and permanent roadway drainage including storm water retention/detention, median drains, catch basins, inlets, laterals, roadside ditches, etc. required for a closed drainage system. This cost also included the placement of an additional main trunk sewer for the I-290 Study. The drainage cost was estimated as a percentage of the total construction cost based on similar local urban major highway reconstruction projects and increased for overall complexities of the project including the additional work associated with the proposed mainline trunk sewer.

4.1.9 Intelligent Transportation System (ITS) and Tolling

This cost category is intended to cover standard items utilized for a typical ITS system and tolling system catered for the Project Corridor. Costs include ramp meters and sensors, toll points, cameras, toll signs, active traffic management equipment, and communication equipment. The cost includes electric toll collection and enforcement for the tolling alternatives. The overall cost extends into both the *Reconstruction* and *Restriping* sections.

4.1.10 Utilities

This cost is intended to cover the cost of relocation or protection of identified utilities within the *Reconstruction Section*. Engineering services for utility work are included in this cost and based on historical percentages of the overall estimated utility construction costs. The known utilities are itemized and unit costs developed using the existing utility type, size, and general construction methodology for either replacement or protection of the utility. The cost will be updated and modified as the project progresses to include actual work plans and engineering costs provided by the utilities based on final design.

4.1.11 Traffic Control (Maintenance of Traffic)

This cost is intended to cover the general traffic control during construction and is based on a percentage of the total construction cost. This category includes all typical traffic control for the I-290 Study and detours including, but not limited to; temporary signing, temporary pavement and pavement markings for minor roadways, temporary signalization, channelizing devices, barricades, etc. Significant temporary improvements associated with the maintenance of traffic are itemized and added to the overall cost including temporary pavement, walls, and structures.

4.1.12 Erosion Control and Landscaping

This cost category is intended to cover the cost of erosion control and landscaping during construction and is based on a percentage of the total construction cost. Erosion control and landscaping costs include all sediment and erosion control, seeding, mulching, etc. to minimize erosion.

4.1.13 Aesthetic Improvements

This cost category is intended to cover standard aesthetic improvements along the *Reconstruction Section* of the project associated with public outreach. The cost is based on a percentage of the associated total construction cost for the project.

4.1.14 Mobilization

This cost is intended to cover the cost of mobilization of the construction workforce based on a percentage of the total construction related cost.

4.1.15 Construction Layout

This cost is intended to cover the cost of construction layout as provided for in construction contracts based on a percentage of the total construction related cost and historical data.

4.2 Structures

This category includes pay items related to roadway structures and retaining walls.

4.2.1 Roadway Structures

Roadway structures consist of grade separated and waterway crossing structures. The structures are subdivided into pedestrian bridges, standard crossroad bridges, interchange bridges, railroad bridges and mainline expressway bridges. Bridge costs are for the structures in the *Reconstruction Section* only and are based on historical square footage determined from newly constructed bridges associated with the Circle Interchange project and other local projects. As the complexity of the bridge design increased, so did the estimated cost per square foot.

4.2.2 Retaining Walls

The cost of the walls is for the *Reconstruction Section* and is based on exposed wall heights determined by proposed cross sections. Both mechanically stabilized earth walls (MSE) and soldier pile walls are assumed to achieve the proposed design. Based on existing terrain and proximity to existing facilities, soldier pile walls are estimated for 80 percent of the total wall locations and MSE walls for the additional 20 percent. The unit pricing for the walls are based on historical unit costs for projects of similar scope and location. Overall, the soldier pile wall unit costs are greater than the unit costs used for MSE walls.

4.3 Land Acquisition, Right-of-Way and Land Remediation

Land values for permanent right-of-way and temporary easement are based on the fair market value of the Cook County Assessor website for Year 2008 and escalated to the current based year. Costs are categorized as either residential or commercial and are reported on a square footage basis. A conceptual cost is included for removal and remediation of hazardous materials during building demolition and earthwork. Assumptions for the amount of soil removed and the quantity of contaminated soil are estimated.

4.4 Environmental Mitigation (Noise Walls)

This cost is intended to cover the cost of the proposed noise abatement wall placement in both the *Reconstruction* and *Restriping Sections*. The noise abatement wall unit cost is generated based on the exposed area of the wall and historical unit cost data. The location and size of the noise abatement walls are approximate and based on the first preliminary round of analysis. Final noise abatement wall location and types have not been determined at this time.

4.5 Engineering Services

This category includes pay items related to engineering design and services, and construction inspection and services. Descriptions of these items are as follows.

4.5.1 Design Engineering Services (Phase 2)

This cost is intended to cover the services associated with detailed design documentation for bidding purposes and to construct the proposed project. The Phase 2 costs are estimated as a percentage of the total construction cost at this time.

4.5.2 Construction Inspection and Services (Phase 3)

This cost is intended to cover the associated construction inspection services to observe and construct the proposed project. The assumed Phase 3 costs are estimated as a percentage of the total construction cost at this time.

4.6 Transit Related Costs

The proposed project will result in impacts to existing Chicago Transit Authority (CTA) crossroad Blue Line station head houses and ramps in the *Reconstruction Section*. Costs were based on historical data from several local transit projects and from the CTA Blue Line Vision Study. Associated costs include the building structure, structural support of each head house and the affected ramp structure only. Stations were divided into major and minor categories based on ridership and current usage for the purposes of the cost estimate. A lump sum was assigned to each major and minor station.

An additional cost is included for railroad flagging in the *Reconstruction Section* of the proposed project for proposed improvements at and along the IHB Railroad, CTA, and CSX Railroads.

4.7 Project Contingency

This cost is intended to cover additional project unknowns such as general project related roadway items not quantified in detail and additional future detailed design development associated with Phase 2 of the project. The project contingency is estimated as a percentage of the total construction cost and determined based on current level of design development at this time and historical data.

This page intentionally left blank

1.0 Sustainability

The Federal Highway Administration (FHWA) "Infrastructure Voluntary Evaluation Sustainability Tool" (INVEST) is a web-based voluntary tool used to measure the sustainability of transportation projects. It was developed with ongoing input from state and local transportation agencies and professional organizations and is based on the three primary principles of sustainability: social equity, responsible use of natural resources, and economic development. The tool is designed to encourage and help agencies and organizations integrate sustainability best practices into highway and roadway projects.

Based on the Department and Stakeholder interest, the project will use the INVEST evaluation tool as part of the project development. INVEST was not used as a measure to evaluate the alternatives, or to determine their suitability for sustainable practices as compared to each other. The methodology and tools suggested by INVEST are being applied to the Preferred Alternative. There is no credit for completing NEPA documentation because it is required for federally funded projects and by many states.

The current Version 1.2 of the INVEST tool includes sustainability scoring in three main categories of highway development: System Planning and Processes, Project Development, and Operations and Maintenance.

The *System Planning and Processes* category focuses on the sustainability efforts within an agency's system planning processes. The System Planning and Processes category covers a broad spectrum of highway development rather than a singular project. The criteria used for scoring an agency's System Planning and Processes includes the level of integration of long-term plans with local and/or regional plans to coordinate transportation, land use, economic development, nature resource planning, and community goals and visions. Scoring criteria also include consideration of system wide multimodal and freight planning, along with other factors such as travel demand management and congestion management strategies, strategies to reduce emissions and energy consumption, practices of cost estimating and revenue forecasting, and asset management. Since the focus of System Planning and Processes is centered on the overall practices and operations of transportation agencies, it is beyond the scope of the I-290 Phase I Study and would not be considered in the evaluation and scoring for the project.

The *Project Development* category includes evaluation and scoring for two different project types. The basic scorecard is for small reconstruction, preservation, or restoration projects. The second category using an extended scorecard is for new construction projects of new roadway facilities or major reconstruction projects. The focus of the Project Development category is on the actual planning, design, and construction of a new highway facility. Projects are awarded a Bronze, Silver, Gold, or Platinum status based on a total number of points achieved. The criteria used for scoring the sustainability of a project during the Project Development phase covers a wide range of

topics including but not limited to cost benefit analysis, educational outreach, ecological connectivity, freight mobility, pavement design, and construction activities. An evaluation of sustainability during the Project Development phase generally requires an advanced level of project detail to accurately score the project's performance in each criterion.

The *Operations and Maintenance* category includes the criteria for evaluating and scoring an agency's programs and practices for their operations and maintenance of roadway facilities. There are 15 criteria used in evaluating the Operations and Maintenance and include items such as tracking the implementation/fulfillment of environmental commitments; use of pavement, bridge, and maintenance management systems; traffic control maintenance plans; roadside and facilities infrastructure maintenance plans; standards of practice for snow and ice control; and plans to document renewable energy use and reductions in fossil fuel use and emissions during operations and maintenance. Since the Operations and Maintenance phase of a highway project comes after the facility has been constructed, it is not considered in the evaluation and scoring of the current I-290 Phase I Study; however, it could be carried forward to evaluate the I-290 corridor's operations and maintenance when the facility is built.

There are five project types for the Project Development module in INVEST: Paving, Rural Basic, Rural Extended, Urban Basic, and Urban Extended. The best fit for the I-290 Phase I Study was determined to be the Urban Extended, which according to the INVEST Compendium [1]is for urban projects for a new roadway facility; structure projects were nothing of its type currently exists; and major reconstruction projects that add travel lanes to an existing roadway or bridge. The urban designation was used because this project traverses through a densely populated urban area, including the City of Chicago, where transit connectivity amenities and other urban considerations would apply.

The INVEST ratings are shown in Table 1. The ratings range from Bronze which would be achieved with 52 points (30 percent), to the highest rating, Platinum, which would be achieved with 103 points (60 percent). Several of the criteria presented require an advanced level of project detail or development. At this stage in the project development process for the I-290 Phase I Study, there is not enough engineering definition and design to assess the project's complete potential implementation of various sustainable practices and strategies. However, an early examination of various sustainable best practices can help inform the future design of the I-290 facility and potential mitigation strategies and help guide decisions regarding roadway design and construction to incorporate as many sustainable elements as appropriate.

[1] INVEST Compendium, Federal Highway Administration, September 2015, https://www.sustainablehighways.org/files/3421.pdf

Table 1. INVEST Ratings for Urban Extended Projects

	Number of Points Required for Each Level
Total Number of Points	172
Bronze (30%)	52
Silver (40%)	69
Gold (50%)	86
Platinum (60%)	103

The preliminary evaluation and scoring for the I-290 Phase I Study is shown in Table 2. Based on this preliminary evaluation, the I-290 Phase I Study achieves 58 out of a maximum 172 points. This provides the current designation of Bronze for the I-290 Phase I Study based on current available information and based on the INVEST 1.2 criteria.

The INVEST scoring will continue to be updated with further project development, including more detailed design. Many of the criteria appear to offer good opportunities to achieve higher ratings at the appropriate time for evaluation by simply following existing state policies. For example, IDOT performs life cycle evaluations of pavement designs (applicable to criterion PD-2) and inserts special provisions in most construction contracts to limit construction emissions (applicable to criterion PD-26). Other criteria (such as criterion PD-8 for ecological connectivity or PD-24 for contractor warranty) require commitments to go above and beyond meeting existing regulatory or policy requirements, but will be considered in current project development.

Table 2. I-290 Phase I Study Preliminary INVEST Scorecard

Criteria	Points
PD-01 Economic Analyses Criterion: • Was a benefit-cost analysis (BCA) for the project completed using minimum acceptable industry practices? Points: [0 / 2] • Was an Economic Impact Analysis (EIA) completed that meets all the listed requirements? Points: [3 / 3] Notes: This criterion may need additional evaluation throughout the Phase I process. Some of the results of this type of analysis were presented at CAG/TF Meeting #18.	3/5
PD-02 Lifecycle Cost Analyses Criterion: • Was an LCCA performed for all pavement structure alternatives in accordance with the method described in the FHWA's Technical Bulletin for Life-Cycle Cost Analysis?	0/3

Criteria	Points
Points: [0 / 1] • Was an LCCA performed for all storm water infrastructure alternatives considered? Points: [0 / 1] • Was an LCCA performed for the project's major feature (bridges, tunnels, retaining walls, or other items not listed in the preceding options) for each of the alternatives considered? Points: [0 / 1] Notes: These will be performed as part of the Phase II design process, but cannot be scored yet.	
PD-03 Context Sensitive Project Development Criterion: • Did the project development process generally follow the six-step CSS framework described in NCHRP report 480 and NCHRP report 642, or an equivalent process? Points: [2 / 2] • Did the project development process feature a "cradle-to-grave" project team that included planners, traffic engineers, public involvement specialists, design engineers, environmental experts, safety specialists, landscape architects, right-of-way staff, freight experts, construction engineers, and others to work on projects who worked together to achieve the desired CSS-based vision for the project? Points: [1 / 1] • As a result of CSS-influenced project development process, were external "champions" for the project created in the affected community who were engaged and proactive in supporting it? Points: [1/ 1] • Was acceptance achieved among project stakeholders on the problems, opportunities, and needs that the project should address and the resulting vision or goals for addressing them? Points: [1/ 1] • Do project features consider the appropriate scale of the project? Points: [1/1] • Did the project remove objectionable or distracting views? Points: [2/2] • Did the project integrate context sensitive aesthetic treatments? Points: [1/1] • Were aesthetics for structural items incorporated into the design of the project? Points: [1/1]	10/10
PD-04 Highway and Traffic Safety Criterion: • Were human factors considerations incorporated? Points: [2 / 2] • Was awareness built among the public regarding contributing factors to crashes? Yes. Points: [1 / 1] • Does the agency conduct explicit consideration of safety using quantitative, scientifically proven methods? Yes. • Was the project type established during scoping of project alternatives through a quantitative, scientifically reliable process? Yes. Points: [1/1] • Were project design and/or operational alternatives developed and evaluated using explicit consideration of substantive safety through quantitative, statistically reliable methods? Yes. Points: [2/2]	9/10

Criteria	Points
• Were quantitative and statistically reliable methods and knowledge used to assess substantive safety performance in the development of preliminary and final design details?: Will incorporate proper safety analysis of design exceptions in both Phase I (Preliminary Design) and Phase II (Final Design)[3/3] • Was a statistically reliable, science-based method used to evaluate the safety effectiveness of the implemented project? No, to be completed after construction. Points: [0/1]	
PD-05 Educational Outreach Criterion: • Did this project incorporate public educational outreach that promotes and educates the public about sustainability by installing or performing a minimum of two different elements from the table provided? Yes. Points: [2 / 2] Note: Sustainability included in project development process; in public involvement; project website; and professional presentations.	2/2
PD-06 Tracking Environmental Commitments Criterion: • Was a comprehensive environmental compliance tracking system used for the project and related facilities? No. Points: [0 / 2] • Does the environmental tracking system have a formal mechanism to communicate commitments from transportation planning through design, construction, and maintenance? No. Points: [0 / 1] • Has the principal project constructor assigned an independent environmental compliance monitor who will provide quality assurance services and report directly to and make recommendations to the regulatory and Lead Agencies? To be determined. Points: [0 / 2] Note: More points could be earned for developing an agency strategy for tracking environmental commitments.	0/5

Criteria	Points
PD-07 Habitat Restoration Criterion: • Was project-specific mitigation or mitigation banking used on this project? No. Points: [0/ 3] • Were high quality aquatic resources (HQAR) avoided or were the impacts minimized on this project? No. Points: [0/2] • Were high quality environmental resources avoided or were the impacts minimized on this project? No. Points: [0/2] Note: No points were given because there are no natural habitats in the project area that needed to be avoided.	0/7
PD-08 Stormwater Criterion: • Did the project treat at least 80 percent of the total runoff volume? Points: [0/ 3] • Did the project manage the flow from at least 80 percent of the total runoff volume, and is flow control based on controlling peak flows or durations from the project site? Points: [0 / 3] Note: These criteria will need further consultation from the Hydraulics Unit and CBBEL to discuss the scoring requirements when final drainage plan is complete.	0/6
PD-09 Ecological Connectivity Criterion: • Was a site-specific ecological assessment of the roadway project using GIS data or regional expertise conducted? Yes. • Were methods used to minimize impacts to ecological connectivity Points: [3 / 3] • Did the project team engage natural resources and regulatory agencies throughout the planning process and ensure consistency with broader planning goals and objectives? Points: [1/1] Note: There will be a animal crossing at the Des Plaines River.	4/4
PD-10 Pedestrian Access Criterion: • Were all facilities upgraded to meet ADA standards and do responses below exclude any projects to upgrade facilities to ADA Standards? Yes. • Were missing pedestrian connections installed per master plan or relevant documents? Yes. Points: [1/1] • Were pedestrian features installed that are safe, comfortable, convenient and connected? Yes. Points: [2/2]	3/3
PD-11 Bicycle Access Criterion:	3/3

Criteria	Points
• Were missing bicycle connections installed per master plan or other relevant documents? Yes. Points: [1/1] • Were bicycle features installed that are safe, comfortable, convenient and connected? Yes. Points: [2/2]	
PD-12 Transit and HOV Access Criterion: • Were Transit and HOV facilities installed on this project that is consistent with the need, purpose, and appropriateness for transit and HOV access within the project footprint? Points [4/5]	4/5
PD-13 Freight Mobility Criterion: • Were freight facilities installed on this project consistent with the need, purpose, and appropriateness for freight mobility within the project footprint? Points: [4 / 7] Note: The points were received for improving railroad overpass clearances and safety improvements.	4/7
PD-14 ITS for System Operations Criterion: • Were one or more allowable ITS applications installed? Yes. Points: [5 / 5] Note: The points in this criterion were achieved for: toll collection; DMS signs; lane management; emergency vehicle signal preemption; enforcement; ramp metering; and surveillance.	5/5

Criteria	Points
PD-15 Historical, Archaeological, and Cultural Preservation Criterion: • Is any part of the project or resource listed in the NRHP or been determined eligible for the NHRP by a State, Local, or Tribal Historic Preservation Officer? Yes. • Has an effort been made to minimize impacts, avoid impacts, or enhance features? Yes, there will be landscaping enhancements in Columbus Park. Points: [3 / 3] Note: This study is avoiding any impacts to these properties.	3/3
PD-16 Scenic, Natural, or Recreational Qualities Criterion: • Is any portion of the project along one of America's Byways®, a State Scenic Byway, an Indian Tribe Scenic Byway, or other route that was designated or officially recognized as such? Points: [0 / 0] • Was existing access to scenic, natural, or recreational qualities not removed (i.e., maintained) as a part of this project unless it was specifically removed to protect the scenic, natural, and/or recreational qualities themselves? Points: [0 / 0] • Were efforts made to minimize impacts, avoid impacts, or enhance features of the scenic, natural, and/or recreational qualities? Points: [0 / 0] Note: I-290 is not designated as a America's Byway, a State Scenic Byway	0/3
PD-17 Energy Efficiency Criterion: • Were energy needs evaluated for the project? Not at the present time. Points: [0 / 1] • Was the energy consumption on the project reduced through the installation of energy efficient lighting and signal fixtures and through the installation of autonomous, on-site, renewable power sources? Yes. • Points are awarded based on the percentage of power use. Based on table PD-17.2.A, how many points did the project earn? Points: [1/6] • Was a plan established for auditing energy use after project completion as part of operations and maintenance? To be determined. Points: [0 / 1] Note: The Lighting Plan is not determined yet. One point was earned for now with the anticipation of LED lighting.	1/8
PD-18 Site Vegetation Criterion: • Does all site vegetation use non-invasive species only, use non-noxious species only, use seeding that does not require consistent mowing for a viable stand of grass, and minimize disturbance of native species? Yes. • Based on Table PD-18.1.A, how many points did the project earn? Points are feature are additive, however the criterion shall not exceed a total of 3 points. Points: [3 / 3] • Based on Table PD-18.2.A, how many points did the project earn for vegetative maintenance? Points for features are cumulative; however this scoring requirement shall not exceed a total of 3 points. Points: [2/3]	5/6

Criteria	Points
PD-19 Reduce and Reuse Materials Criterion: • Was remaining service life increased through pavement preservation activities? Points are awarded per Table PD-19.1.A. TBD. Points: [0/4] • Was the amount of new pavement materials needed reduced? Points are awarded per Table PD-19.2.A. TBD. Points: [0/3] • Was remaining service life increased through bridge preservation activities? Points are awarded per Table PD-19.3.A. TBD. Points: [0/4] • Was remaining service life increased through retrofitting existing bridge structures? Points are awarded per Table PD-19.3.A. TBD. Points: [0/3] • Were existing pavements, structures, or structural elements reused for a new use? Points are awarded per Table PD-19.5.A. TBD. Points: [0/3] • Were industrial by-products reused in pavement materials, ancillary structures, and other roadway elements? TBD. Points: [0 / 2] • Was a project-specific plan for the recycling and reuse plan developed as described? No. Points: [0/1] Note: Defer to Phase II/III	0/12
PD-20 Recycle Materials Criterion: • Was RAP or RCA used in new pavement lifts, granular base course, or embankments? TBD. Points: [0/5] • Were pavement materials recycled in place using cold-in-place recycling, hot-in-place recycling, and full depth reclamation methods? Points are awarded per Table PD-20.2.A. TBD. Points: [0/6] • Did the project reuse subbase granular material as subgrade embankment or as part of the new subbase? TBD. Points: [0/2] • Did the project relocate and reuse at least 90 percent of the minor structural elements, including existing luminaries, signal poles, and sign structures that are required to be removed and/or relocated onsite? TBD. Points: [0 /1] • Did the project salvage or relocate existing buildings? TBD. Points: [0/2] Note: Defer to Phase II/III	0/10
PD-21 Earthwork Balance Criterion: • Are the design cut and fill volumes or the actual construction cut and fill volumes balanced to within 10 percent? TBD. Points: [0 / 3] • Has an earthwork management plan been established, implemented and actively managed on this project? TBD. Points: [0/1] • Has topsoil been preserved or reused on this project? TBD. Points: [0/1] Note: Defer to Phase II/III	0/5
PD-22 Long-Life Pavement Design Criterion: • Which of the following best describes how long-life pavement was used on this project? TBD. No long life pavement was used or it was and did not meet the minimum requirements of the options below. TBD. Points: [0 / 5]	0/7

Criteria	Points
• Was the asphalt density of 100 percent of the total new or reconstructed pavement increased to a minimum of 94 percent? TBD. Points: [0/5] • Was a performance-based pay incentive for pavement smoothness used on this project? TBD. Points: [0/2] Note: Defer to Phase II/III	
PD-23 Reduced Energy and Emissions in Pavement Materials Criterion: • Was at least 50 percent of the total project pavement material (by weight) a low-energy material from asphalt production? TBD. Points: [0 / 3] • Was at least 50 percent of the total project pavement material (by weight) a low-energy material from cement production? TBD. Points: [0 / 3] • Was at least 50 percent of the total project pavement material (by weight) a low-energy material from concrete production? TBD. Points: [0 / 3] Note: Defer to Phase II/III	0/3
PD-24 Permeable Pavement Criterion: • Does the project include a maintenance plan for permeable pavements and are permeable pavements placed in areas where no sand will be used for snow and ice control or pavement sealing? TBD. Points: [0 /2] Note: Defer to Phase II/III – Spec, this pavement could be used on the new East-West trail.	0/2
PD-25 Construction Environmental Training Criterion: • Did the owner require the Contractor to plan and implement a formal environmental awareness training program during construction to ensure the project stay in compliance with environmental laws, regulations, and policies? TBD. Points: [0 / 1] Note: Defer to Phase II/III – Spec	0/1
PD-26 Construction Equipment Emission Reduction Criterion: • Were one or more methods implemented to reduce non-road emissions? Points are awarded per Table PD-26.1.A. TBD. Points: [0 / 2] Note: Defer to Phase III	0/2
PD-27 Construction Noise Mitigation Criterion: • Is the contractor required to establish, implement, and maintain a formal Noise Mitigation Plan (NMP) during roadway construction? TBD. Points: [0/1] • Has the contractor monitored noise and the effectiveness of mitigation measures at the receptors throughout construction to ensure compliance with the NMP? TBD. Points: [0/1]	0/2

Criteria	Points
Note: Defer to Phase II/III-Spec	
PD-28 Construction Quality Control Plan Criterion: • Is the Contractor required to plan and implement quality control measures throughout construction with care and for materials above and beyond what is typically required by specifications and regulations? TBD. Points: [0 / 3] • Does the contract leverage the use of Quality Price Adjustment Clauses to link payment and performance of the constructed products? TBD. Points: [0 / 2] Note: Defer to Phase II/III-Spec	0/5

Criteria	Points
PD-29 Construction Waste Management Criterion: • Is the contractor required to establish, implement, and maintain a formal Construction and Demolition Waste Management Plan (CWMP) during roadway construction, or its functional equivalent? TBD. Points: [0 / 1] • Can the owner demonstrate that a percentage of the construction waste has been diverted from landfills? TBD. Points: [0 / 2] • Were excess materials hauled directly to other project sites for recycling on those projects? TBD. Points: [0/1] Note: Defer to Phase II/II-Spec	0/4
PD-30 Low Impact Development Criterion: • Did the project use effective BMPs or stormwater management techniques that mimic natural hydrology to treat pollutants? Use Tables PD-30.1.A and PD-30.1.B and PD-30.1.C to determine points. TBD. Points: [0/3] Note: These criteria will need further consultation from the Hydraulics Unit and CBBEL to discuss the scoring requirements when final drainage plan is complete.	0/3
PD-31 Infrastructure Resiliency Planning and Design Criterion: • Did the project incorporate consideration of climate change at a project-specific level in project development and environmental reviews? Not considering at this time. Will need to reevaluate in Phase II. Points: [0/2] • Did the project incorporate future consideration of climate change effects in the design process? Not considering at this time. Will need to reevaluate in Phase II. Points: [0/6] • Did the project mitigate the effects of GHG emissions through design efforts above and beyond requirements and regulations? Not considering at this time. Will need to reevaluate in Phase II. There may be an opportunity for points with congestion pricing and traffic management. Points: [0/4]	0/12
PD-32 Light Pollution Criterion: • Were the uplighting ratings met on this project per Table PD-32.1.A? TBD. Points [0/1] • Were the backlighting ratings met on this project per Table PD-32.2.A? TBD. Points [0/1] • Were the glare ratings met on this project per Table PD-32.3.A? TBD. Points [0/1]	0/3

Criteria	Points
PD-33 Noise Abatement Criterion: • Was a specialized noise barrier used on this project? Yes. Points [2/2] • Were traffic system management techniques used to reduce existing noise levels? TBD. Points [0/2] • Were buffer zones provided for adjacent noise sensitive receptors? TBD. Points [0/2] • Were quiet pavements used on the project? Use Table PD-33.4.A. TBD. Points [0/3] • Were plantings used as a sight screen to separate noise receptors from the project? TBD. Possibly at Columbus Park. Points [0/1]	2/3

Additional opportunities for INVEST credit appear to be highest in the following areas, which could be addressed during further project development. Achievement of most of these opportunities, along with improvements in remaining categories, indicates that Platinum Status (requiring an additional 49 points) should be a reasonable achievement to meet or exceed with the I-290 Project.

- PD-08 Storm water (6 additional points possible)
- PD-17 Energy Efficiency (7 additional points possible)
- PD-19 Reduce and Re-use Materials (12 additional points possible)
- PD-20 Recycling (10 additional points possible)
- PD-21 Earthwork Balance (5 additional points possible)
- PD-22 Long-life Pavement Design (7 additional points possible)
- PD-28 Construction Quality Control Plan (5 additional points possible)
- PD-31 Infrastructure Resiliency Planning and Design (12 additional points possible)

Appendix O

Response to DEIS Comments

I-290 Eisenhower Expressway
Cook County, Illinois

Prepared For:
Illinois Department of Transportation

Prepared By:
WSP USA

June 2017

This page intentionally left blank

Appendix O Table of Contents

The Notice of Availability for the DEIS was published in the Federal Register on December 30, 2016, effectively opening the public comment period on the DEIS. The public comment period closed on February 28, 2017. However, five comments were received after that date, were included in the project record, and are addressed in this FEIS. Approximately 332 unique comments were received from federal agencies, local governments, individuals, and organizations. Unique comments were identified by annotating all comments received into those that could be considered standalone comments. Thus, a single communication could contain many unique comments.

Each communication received during the DEIS Comment Period is listed here in this Table of Comments by commenter name according to Federal Agencies, Local Governments, Public Organizations, and Individuals.

Federal Agency Comments

Forest County Potawatomi, Natural Resources – LaRonge, Michael O-1
U.S. Army Corps of Engineers, Chicago District –Rimbault, Julie..... O-1
U.S. Department of Interior – Nelson, Lindy O-1
U.S. Environmental Protection Agency – Westlake, Kenneth..... O-3

Local Government Comments

Cook County Board of Commissioners – Orbon, Tara..... O-12
DuPage County - Cronin, Daniel J..... O-12
Forest Preserve District of DuPage County – Cantore, Joseph. O-13
Metropolitan Water Reclamation District of Greater Chicago – O'Connor, Catherine A. O-13
Village of Oak Park – Kaare, Doug..... O-14
Village of Oak Park – McKenna, Bill O-14

Public Organization Comments

Active Transportation Alliance – Burke, Ron O-15
Citizens for Appropriate Transportation – Kuner, Rick..... O-22
Grant Park Conservancy – O'Neill, Robert O-33
North Lawndale Community Coordinating Council – Norrington, Paul O-33

RESPONSE TO COMMENTS - FEDERAL AGENCY COMMENTS

#	Agency	Comment / Response (*in italics*)
1	LaRonge – Forest County Potawatomi Natural Resources	Pursuant to consultation under Section 106 of the National Historic Preservation Act (1966 as amended), the forest County Potawatomi as a Federally Recognized Native American Tribe reserves the right to comment on Federal undertakings, as defined under the Act. Thank you for your participation in the process. This response is related to the project described above. I have reviewed the Draft EIS submitted for comment by Illinois DOT. While the document seems very comprehensive in relation to historic properties related to architecture I have some questions regarding the archaeological component of the study. It is clearly stated that there are no known archaeological sites within the project APE, but it is unclear what was done. What sort of identification effort was made, was there an archaeological study, or just an archival review? A letter from Brad Koldehoff to Dr. Rachel Leibowitz dated May 27, 2016 states there has been an archaeological clearance under a letter from August 13, 2015, but the letter was not included in Appendix E-4. If there was an archaeological identification survey the Tribal Historic Preservation Office on behalf of the Forest County Potawatomi Community requests a copy of the report, an electronic copy is fine or access to it online if available.
		The 106 Illinois State Archaeological Survey (ISAS) personnel completed Phase I Survey Reports in 2010 and 2015 to identify historical and archaeological resources potentially affected by the I-290 project. Both surveys resulted in the identification of no archaeological sites, and therefore, no archaeological properties would be affected by the project. The archaeological clearance letters with Illinois SHPO concurrence are included in the DEIS Appendix E-5 – Agency Correspondence and Concurrence on Archaeological Investigations. A copy of the Phase I Survey short report as well as SHPO consultation and concurrence with the "no adverse effect" finding was provided to the Forest County Potawatomi Community on June 8, 2017.
2	Rimbault – USACE, Chicago District	Based on the information submitted, it appears that any of the alternatives (except the no build) will impact waters of the U.S. but that the permanent impacts will be below 1 acre.
		Permanent impacts of the Preferred Alternative to Waters of the U.S. (WOUS) remain unchanged from that reported in the FEIS (0.4 acre). IDOT will, accordingly, obtain a US Army Corps of Engineers Section 404 permit prior to commencement of any construction in WOUS.
3	Rimbault – USACE, Chicago District	In that case, the applicant will need to submit a permit application to the Army Corps of Engineers Chicago District to obtain a Section 404 permit. At this time, it is anticipated that the project will be reviewed under Regional Permit 3. The project should be designed to comply with this permits conditions.
		The clarification that the project may be processed in the Section 404 permit application as a Regional Permit 3 is noted, and the project will be designed consistent with the conditions of this permit.
4	Rimbault – USACE, Chicago District	The wetland delineation will need to be updated prior to submitting an application.
		An updated wetland delineation will be prepared and submitted to the Army Corps of Engineers prior to submitting a Section 404 permit application.
5	Nelson – US Department of Interior	The summary notes that, in addition to Columbus Park, five properties listed on the National Register of Historic Places (NRHP), and one historic district pending NRHP designation, are within the area of potential effects. The Department assumes that consultation with the SHPO and IHPA will include discussion of those properties as well.
		It is correct that Columbus Park, the five NRHP-listed properties and the one property pending NRHP-designation were evaluated in the Section 106 Effects Assessment Report. These findings were released in April 2017 to the consulting parties and the Illinois SHPO, along with a second meeting with these parties to receive comments, in advance of the FEIS/ROD. Written comments were received from the Park District of Oak Park regarding potential vibration-related impacts to the Oak Park Conservatory during construction. The

#	Agency	Comment / Response (*in italics*)
		SHPO concurred in FHWA's determination of "no adverse effect" for the project, including the five NRHP-listed and one pending NRHP-designated properties, in writing on May 25, 2017.
6	Nelson – US Department of Interior	The DEIS did not identify any properties in the project study area to be considered under Section 6(f) of the Land and Water Conservation Fund (LWCF) Act of 1965 (54 U.S.C. 200305(f)(3) et seq.) or the Urban Park and Recreation Recovery (UPARR) Act of 1978. The Department has determined that Forest Park and Garfield Park are within the area of potential effects and are encumbered under LWCF, and that Columbus Park is encumbered under UPARR. The proposed project constitutes a use that will partially convert these recreational resources. The LWCF Act states "No property acquired or developed with assistance under this section shall, without the approval of the Secretary, be converted to other than public outdoor recreation uses. The Secretary shall approve such conversion only if he finds it to be in accord with the then existing comprehensive statewide outdoor recreation plan and only upon such conditions as he deems necessary to assure the substitution of other recreation properties of at least equal fair market value and of reasonably equivalent usefulness and location." The UPARR Act states "No property improved or developed with UPARR assistance shall, without the approval of NPS, be converted to other than public recreation uses. A conversion will only be approved if it is found to be in accord with the current local park and recreation Recovery Act Program and/or equivalent recreation plan and only upon such condition as deems necessary to assure the provision of adequate recreation properties and opportunities of reasonably equivalent location and usefulness. Section 1010 is designed to ensure that areas or facilities receiving UPARR grant assistance are continually maintained in recreation use and available to the general public."
		The following addresses the conclusion that three parks reported in the DEIS will be encumbered under Land and Water Management Conservation (LWCF) funds or by the Urban Park and Recreation Recovery Act (UPARR): 1) Forest Park - LWCF funds were used by the Park District of Forest Park to develop facilities along DesPlaines Avenue including a softball museum and an inline skate park. These facilities, and the park would not be impacted or converted in any way by the project. Adjacent to the Park District property, the Roos property was purchased and is being developed by the Park District using Parks and Recreation Construction (PARC) and Open Space and Land Acquisition Development (OSLAD) grant money. IDOT is proposing a 10-foot wide temporary easement along the eastern edge of this property to accommodate reconstruction of the Circle Avenue bridge, which would not require any conversion of this property; 2) Garfield Park - I-290 work in the vicinity of Garfield Park includes bridge rehabilitation and noise wall construction. The expressway would not be reconstructed in this section, and the bridge work would only include the rehabilitation of the South Independence Boulevard bridges on existing IDOT right-of-way. Noise walls would be constructed entirely within the existing I-290 right-of-way. Therefore, no impact would occur to the park or result in a conversion of park property; and 3) Columbus Park - I-290 related enhancements are limited to the existing south perimeter of Columbus Park, and would occur within an existing landscaped and turf area. No conversion of park property is proposed. It is our understanding that the referenced UPARR Funds were used for the Fieldhouse which is removed from the area of proposed improvements; consequently, no conversion of this facility would occur.
7	Nelson – US Department of Interior	Impacts to and conversions of LWCF- and UPARR-encumbered properties require coordination with the State of Illinois Department of Natural Resources, the Village of Forest Park, the City of Chicago, and the National Park Service. The DEIS notes that efforts were made to avoid impacts to 4(f) resources and to find ways to reduce the severity of the impacts in consultation with the Illinois State Historic Preservation Officer (SHPO) and other consulting parties. The Department withholds its concurrence that all possible planning was done to minimize harm to 4(f) resources until SHPO concurrence is received and impacts to LWCF- and UPARR-encumbered properties is resolved.
		An Effects Assessment Report was completed consistent with the requirements of Section 106 of the National Historic Preservation Act. This document was distributed to the consulting parties and the Illinois SHPO for review and comment for a 30-day review period in April 2017. Written comments were received from the Park District of Oak Park regarding potential vibration-related impacts to the Oak Park Conservatory during construction. SHPO concurred with FHWA's determination of "no adverse effects" for the project on May 25, 2017. FHWA and IDOT reported out the results of this consultation to the Department of the Interior, National Park Service.

#	Agency	Comment / Response (*in italics*)
8	Westlake – US Environmental Protection Agency	Social/Economic Characteristics Methodology: The socio-economic analysis appears to rely on demographic information for the entire City of Chicago to represent populations impacted by the corridor. We note use of both "Chicago" and "Chicago (within I- 290 Study Area)" in discussions, tables, and figures throughout Section 3.1. Use of the entire City of Chicago is not an appropriate or meaningful geographic unit of analysis because actual, corridor-adjacent conditions are masked by city-wide demographics. For instance, in the discussion on page 3-8 regarding age, the Draft Environmental Impact Statement (EIS) states that four communities along the corridor have higher percentages of young children (under the age of 18) compared to the reference population of Cook County. The methodology should use the more appropriate and reflective "Chicago (within I-290 Study Area)". Thus, this section should state there are five communities, including "Chicago (within the I-290 Study Area)", which exceeds the reference population for children, at 24.8%. For context, EPA finds the discussion and data table regarding Auto Ownership to be most meaningful. Recommendation: We recommend the Final EIS include discussions and data that are clearer and more representative of the potentially impacted communities within the city limits of Chicago. IDOT/FHWA should consider removing data related to the entire city (for comparison purposes) and rely on data that represents Chicago within the I-290 Study Area. If IDOT/FHWA continue to include the entire city of Chicago dataset, EPA recommends clarifying why this information is the more appropriate geographic unit of analysis.
		In analyzing social/economic conditions in the Study Area, reference to smaller geographic areas in the City of Chicago was clarified where the data cited is available. In those instances, "Chicago (within the I-290 Study Area)" was the population referenced. For certain types of demographics, e.g. major employers, data is not available for smaller geographic units other than the City and, in those instances, reference remains to the City of Chicago. An explanation of variability in the data sets will be provided in the introduction to this subsection of the FEIS.
9	Westlake – US Environmental Protection Agency	EPA notes the city of Cicero is included in the analysis but the city of Berwyn is not. The Draft EIS states that communities "that are either partially or wholly within the Project Corridor are listed." The city limits of Cicero do not appear to intersect with the Project Corridor. The city limits of Berwyn (immediately west of Cicero) appear to be similarly situated from I-290 as the city limits of Cicero, but does not appear to be included in the analysis. Recommendation: EPA recommends the Final EIS clarify why Berwyn was not included in the analysis, when it appears to have the similar adjacency to the project corridor as Cicero.
		The City of Berwyn does not fall within a 0.5-mile buffer of I-290 (i.e. the Project Corridor), like the City of Cicero. For this reason, population statistics were not reported in the EIS for Berwyn. The application of the buffer was clarified relative to the communities within or proximate to the Project Corridor.
10	Westlake – US Environmental Protection Agency	Environmental Justice The Draft EIS provided case studies and other data to demonstrate that the tolling aspect of the preferred alternative will not result in a disproportionately high and adverse impact to low-income and minority populations impacted by the project. The analysis also mentioned several potential remedial strategies, such as increased promotion of car- or van-pooling or toll subsidy programs for low-income households, implemented in other communities across the country. The analysis did not specify whether the project team would consider implementation of similar programs, nor whether the unique economic situations of low-income households might impact the success of those programs (for instance, low-income households may not have bank accounts to link to toll transponders to receive discounted or subsidized fares). Recommendation: EPA is aware that exact tolling mechanisms have not been identified. However, we recommend the Final EIS clarify whether IDOT/FHWA will consider mitigation measures to ensure low-income users of the road have equitable opportunity to use the HOT 3+ lane; this may or may not include the above-referenced toll subsidies discussed in the Draft EIS for other areas of the country. If appropriate, we recommend committing to any toll mitigation in the Record of Decision (ROD).
		Subsequent Phase II engineering and financial studies will define tolling policies and toll rate structure. Any mitigation measures will be defined when the specifics regarding the application of tolls are decided.

#	Agency	Comment / Response (*in italics*)
11	Westlake – US Environmental Protection Agency	Children's Health The Draft EIS did not include language regarding the particular vulnerabilities children may face from adverse impacts to air quality during construction activities (Section 3.14.3, Construction Impacts, Air Quality). We note the inclusion of general construction-related best practices to reduce emissions. However, EPA has identified additional measures to further reduce impacts to potentially susceptible populations within the project corridor. Recommendation: EPA recommends that Section 3.14.3 (Construction Impacts, Air Quality) be updated to speak to the particular vulnerabilities of children's health when exposed to increased construction-related emissions. We also recommend the following mitigation measures to further reduce potential adverse impacts to children (see below for additional specific construction emissions reduction measures under Air Quality): • EPA recommends considering the use of the Air Quality Flag Program' during construction to communicate with local communities, particularly with schools and childcare centers, about potential changes in air quality and allow, among other things, for schools or other organizations to adjust their planned outdoor activities. TI1e Air Quality Flag Program reflects regional-scale air quality on a given day and provides baseline conditions that might be exacerbated by construction activity. • In order to limit exposure to construction-related emissions, EPA recommends considering limiting construction timing to outside of school and child care operating hours, where construction is planned adjacent to schools and childcare centers.
		IDOT routinely develops communication plans for major projects such as the I-290 reconstruction. As noted above, committing to specific communication strategies would be premature, given the additional analysis and stakeholder coordination required (i.e., Phase II) to fully understand the construction aspects of the project. However, the development of a Communication Plan during Phase II, which considers techniques such as the Flag Program, will be listed as a Special Design and Construction Consideration in the Combined Design Report. *Limiting construction activities near schools and child care facilities, without a Phase II level of analysis and coordination would be premature. In addition, the Department has in place Article 107.35 Construction Noise Restrictions in the Standard Specifications that states: "construction within 1000' of a residence, motel, hospital, or similar receptor shall be confined to the period beginning at 7:00 a.m. and ending at 10:00 p.m. Machines regulated by Federal or State standards shall conform to these standards." While some work will likely be conducted during overnight hours (i.e., erecting beams), the Department often encounters community opposition to full scale night time work. In addition, multiple restrictions on work hours could also prolong the construction activities in the vicinity of a sensitive receptor. A Special Design and Construction Consideration will be listed in the CDR that captures this request, and will be further evaluated during Phase II.* *With respect to limiting other construction activities near sensitive areas, the Department also has in place Article 107.41 Construction Air Quality (a) Idling Restrictions in the Standard Specifications that states: "Contractor shall establish truck staging areas away from sensitive receptors including schools, day care locations and residences."*
12	Westlake – US Environmental Protection Agency	EPA previously expressed concern about potential construction-related air impacts, including lead releases as a result of bridge and other infrastructure demolition. We note the discussion of "normal lead based paint" in Section 3 .11.1.1, including the definition of de minimis conditions, but the Draft EIS does not indicate whether lead testing has been conducted or verified on bridges proposed for demolition, nor consideration of potential mitigation measures to reduce lead exposure to children within the corridor. Recommendations: EPA recommends the following information regarding construction-related air emissions, including lead, be included in the Final EIS; mitigation should be committed to in the ROD, as appropriate. • The Final EIS should clarify the extent to which IDOT/FHWA have considered potential lead releases (from paint chips or dust) during bridge and infrastructure demolition, including whether lead testing has been conducted. If lead testing indicates the likelihood of releases, we recommend the use of contractors that are trained and certified to conduct· lead-abatement activities and that they apply appropriate lead-safe work practices. Specific mitigation measures might include containment, end-of-workday cleanup and proper storage of debris and waste, the placement of barriers to prevent lead dust from leaving from the site, the use of personal protective

#	Agency	Comment / Response (*in italics*)
		equipment by workers, protocols for entering and exiting the work area and the posting of warnings signs. All other relevant or applicable federal environmental regulations should apply, including the Occupational and Safety Hazard Administrations' lead in construction standards. • If lead testing indicates there will likely be releases, we recommend targeted outreach to schools and childcare centers within the project corridor to limit exposure to children. We also recommend working with the Chicago and Cook County Departments of Public Health to guide the outreach efforts. Outreach materials might focus on limiting outdoor play and/or open windows during posted construction times. EPA also recommends the following to minimize exposure to lead: washing hands before eating and after coming in from outside, keeping "outside" shoes outside of the school/childcare center, and wet-washing floors, window sills, and window wells every day.
		As noted above, the Phase I/NEPA process is conceptual, and therefore does not yield detailed information about the extent of lead in the project area. During the Phase I/NEPA process, hundreds of parcels were researched and a Preliminary Environmental Site Assessment (PESA) was developed, which identifies areas of likely contamination. During Phase II, a Preliminary Site Investigation (PSI) will be conducted for the appropriate areas, and will include sampling and analysis. Therefore, at this time, lead presence/concentration in the soil, as well as the bridge beams are unknown. However, this issue will be addressed by IDOT's standard specifications: *Section 669 Removal and Disposal of Regulated Substances* *Article 669.05 Site Contamination Operation Plan* *Article 669.06 Site Health and Safety Plan* *The following is IDOT's Special Provision that applies to the bridge beams:* *General Bridge Special Provision (GBSP) 26 – Containment and Disposal of Lead Paint Cleaning Residues.* *The work consists of containment, collection, temporary storage, transportation and disposal from lead paint removal projects. The contractor is to take appropriate precautions to protect the public from inhalation or ingestion of dust or debris from operations. The specification states:* *"The Contractor shall comply with the requirements of this Specification and all applicable Federal, State, and Local laws, codes, and regulations, including, but not limited to the regulations of the United States Environmental Protection Agency (USEPA), Occupational Safety and Health Administration (OSHA), and Illinois Environmental Protection Agency (IEPA). The Contractor shall comply with all applicable regulations even if the regulation is not specifically referenced herein. If a Federal, State, or Local regulation is more restrictive than the requirements of this Specification, the more restrictive requirements shall prevail."* *The contractor to include the following plans and provisions: Containment plans, environmental controls and monitoring plan, waste management plan, contingency plan, quality control inspections, wind provisions, filtration requirements, ambient air monitoring, regulated areas, hygiene facilities/protective clothing/blood tests, site emergencies and contingency plans, collection/storage/transportation.* *The GBSP cites the references below:* *IL EPA – information statement on the removal of lead-based paint from exterior surfaces* *IL Environmental Protection Act* *29 CFR 1926.62, lead in construction* *40 CFR Part 50 – appendix B & G – determination of lead in suspended particulate matter collected from ambient air* *SSPC Guide 16, Guide to specifying and selecting dust collectors*

#	Agency	Comment / Response (*in italics*)
		SSPC TU-7 – conducting ambient air, soil, and water sampling activities during surface preparation, and paint disturbance activities *Regarding concerns about lead contamination in soil and dust, IDOT has a Specification Section dedicated to regulated substances. During Phase II, IDOT will conduct soil sampling and testing throughout the corridor to identify special waste locations (standard procedure). Where soil is identified as non-special waste and special waste, safeguards are employed per the below discussion to prevent releases.* *<u>Section 669 Removal and Disposal of Regulated Substances.</u> Selected articles are provided below:* *Article 669.01 This work shall consist of transportation and proper disposal of contaminated soil and water.* *Article 669.04 The Contractor shall file a written Site Contamination Operation Plan. Site Health and Safety Plan and Erosion Control Plan applicable for all personnel working on the project. The Contractor shall control and minimize the release of dust during non-special waste, special waste and Hazardous waste removal areas. The contractor shall submit in writing or include in the Site Contamination Operation Plan and description of intended dust control measures to the Department for approval. Three distinct zones (Exclusion, Decontamination and Support) will be created in order to manage the waste materials, if any, from the project site.* *The Communication Plan Special Provision will include guidelines for communicating to stakeholders and agencies relevant information about everyday occurrences and potential exposures to routine construction dust. This will include information with respect to minimizing and/or preventing construction dust exposure adjacent to the corridor.* *In the unlikely event that there is an inadvertent release of contaminated material from lead paint removal and/or special waste removal processes, a statement is included in GBSP 26 – Containment and Disposal of Lead Paint Cleaning residues that could be used to alert the community that extra precautions are necessary. The statement reads as follows:* *Emergency procedures statement: "if human health or the environment is threatened, contact the appropriate police and fire department. In addition, the Emergency Services and Disaster Agency needs to be called using their 24-hour toll free number (800-782-7860) and the National Response Center using their 24-hour toll free number (800-824-882)."* *The development of a Communication Plan during Phase II, including procedures for notifying stakeholders in case of an emergency, will be listed as a Special Design and Construction Consideration in the Combined Design Report.*
13	Westlake – US Environmental Protection Agency	EPA notes Traffic Noise (Section 3 .4) addresses impacts to most sensitive land uses (residences, schools, parks, and places of worship) but Construction Noise (Section 3. I 4.4) does not include an assessment of noise to sensitive receptors. Speech interference in schools should be considered when determining disproportionate impacts from construction activities. Children's ability to learn in school is very important to their development and future success. Studies have shown that classroom noise lowers performance on standardized tests and academic achievement has a well-documented effect on health. Recommendations: EPA recommends that Section 3.I 4.4 (Construction Noise and Vibration) be updated to specifically address impacts to children in the learning environment, as directed by Executive Order 13045 Protection of Children from Environmental Health Risks and Safety Risks. Potential mitigation measures may include limiting construction to outside of school and childcare operation hours, which would also reduce potential impacts to children from construction-related air emissions (as discussed above)
		IDOT has in place measures to address construction noise as stated in the Standard Specification Article 107.35 – Construction Noise Restrictions. Provisions included in the standard specification include: *Adequate mufflers and maintenance to prevent excessive noise.*

#	Agency	Comment / Response (*in italics*)
		Construction within 1,000 ft. of residence, motel, hospital, or similar receptor confined between 7 am and 10 pm.
14	Westlake – US Environmental Protection Agency	Air Quality EPA recognizes that the project area is in attainment for all National Ambient Air Quality Standards (NAAQS), except for ozone. However, diesel emissions and fugitive dust from project construction may pose environmental and human health risks and should be minimized. In 2002, EPA classified diesel emissions as a likely human carcinogen, and in 2012 the International Agency for Research on Cancer concluded that diesel exhaust is carcinogenic to humans. Acute exposures can lead to other health problems, such as eye and nose irritation, headaches, nausea, asthma, and other respiratory system issues. Longer term exposure may worsen heart and lung disease 4 Because the preferred alternative will include several years of construction near a large population center, EPA has identified several mitigation measures to further reduce emissions related to construction, to supplement the discussion in Section 3.3.3.2. Recommendations: EPA recommends IDOT/FHWA consider the following protective measures and commit to applicable measures in the ROD. Mobile and Stationary Source Diesel Controls: Purchase or solicit bids that require the use of vehicles that are equipped with zero-emission technologies or the most advanced emission control systems available. Commit to the best available emissions control technologies for project equipment in order to meet the following standards. • On-Highway Vehicles: On-highway vehicles should meet, or exceed, the EPA exhaust emissions standards for model year 2010 and newer heavy-duty, on-highway compression-ignition engines (e.g., long-haul trucks, refuse haulers, shuttle buses, etc.).
		IDOT has in place measures to address construction air quality as stated in the Standard Specification Article 107.41 "All equipment on the jobsite, with engine ratings of 50 hp and above, shall exclusively use Ultra Low Sulfur Diesel (ULSD) fuel (15 ppm sulfur content or less)." *In addition, there are a series of special provisions developed to address construction air quality including:* *BDE Special Provision Check sheet 17: addresses reduction of particulate matter for off-road equipment via retrofit emission control devices* *Special Provision Construction Air Quality: Diesel Retrofit (BDE) specifies requirements for all off-road diesel powered equipment. The requirement is:* *"The retrofit emission control devices shall achieve a minimum PM emission reduction of 50 percent and shall be:* *a) Included on the U.S. Environmental Protection Agency (USEPA) Verified Retrofit Technology List (http://www.epa.gov/cleandiesel/verification/verif-list.htm), or verified by the California Air Resources Board (CARB) (http://www.arb.ca.gov/diesel/verdev/vt/cvt.htm) ; or* *b) Retrofitted with a non-verified diesel retrofit emission control device if verified retrofit emission control devices are not available for equipment proposed to be used on the project, and if the Contractor has obtained a performance certification from the retrofit device manufacturer that the emission control device provides a minimum PM emission reduction of 50 percent."* *The only exemptions in the Special Provision are as follows:* *"Note: Large cranes (Crawler mounted cranes) which are responsible for critical lift operations are exempt from installing retrofit emission control devices if such devices adversely affect equipment operation.* *Diesel powered off-road equipment with engine ratings of 50 hp and above, which are unable to be retrofitted with verified emission control devices, or if performance certifications are not available which will achieve a minimum 50 percent PM reduction, may be granted a waiver by the Department if documentation is provided showing good faith efforts were made by the Contractor to retrofit the equipment."*

#	Agency	Comment / Response (*in italics*)
15	Westlake – US Environmental Protection Agency	• Non-road Vehicles and Equipment: Non-road vehicles and equipment should meet, or exceed, the EPA Tier 4 exhaust emissions standards for heavy-duty, non-road compression-ignition engines (e.g., construction equipment, non-road trucks, etc.). • Low Emission Equipment Exemptions: The equipment specifications outlined above should be met unless: 1) a piece of specialized equipment is not available for purchase or lease within the United States; or 2) the relevant project contractor has been awarded funds to retrofit existing equipment, or purchase/lease new equipment, but the funds are not yet available. Consider requiring the following best practices through the construction contracting or oversight process: • Use onsite renewable electricity generation and/or grid-based electricity rather than diesel-powered generators or other equipment. • Use ultra-low sulfur diesel fuel (15 ppm maximum) in construction vehicles and equipment. • Use catalytic converters to reduce carbon monoxide, aldehydes, and hydrocarbons in diesel fumes. These devices must be used with low sulfur fuels. • Use electric starting aids such as block heaters with older vehicles to warm the engine. • Regularly maintain diesel engines to keep exhaust emissions low. Follow the manufacturer's recommended maintenance schedule and procedures. Smoke color can signal the need for maintenance (e.g., blue/black smoke indicates that an engine requires servicing or tuning). • Retrofit engines with an exhaust filtration device to capture diesel particulate matter before it enters the construction site. • Repower older vehicles and/or equipment with diesel- or alternatively-fueled engines certified to meet newer, more stringent emissions standards (e.g., plug-in hybrid-electric vehicles, battery-electric vehicles, fuel cell electric vehicles, advanced technology locomotives, etc.). • Retire older vehicles, given the significant contribution of vehicle emissions to the poor air quality conditions. Implement programs to encourage the voluntary removal from use and the marketplace of pre-2010 model year on-highway vehicles (e.g., scrappage rebates) and replace them with newer vehicles that meet or exceed the latest EPA exhaust emissions standards.
		• *There are no requirements for use of on-site renewable energy.* • *Catalytic converters will be required based on the use of ultra-low sulfur fuel.* • *There are no specific requirements in the IDOT Specifications regarding starting aids, engine retrofit, repowering older vehicles or retiring older vehicles. These are considered the Contractor's means and methods. However, there are limitations imposed on the emissions of all vehicles on the job site.* • *The development of a project specific Construction Air Quality Special Provision will be listed as a Special Design and Construction Consideration in the Combined Design Report.*
16	Westlake – US Environmental Protection Agency	Fugitive Dust Source Controls • Stabilize open storage piles and disturbed areas by covering and/or applying water or chemical/organic dust palliative, where appropriate. This applies to both inactive and active sites, during workdays, weekends, holidays, and windy conditions • Install wind fencing and phase grading operations where appropriate, and operate water trucks for stabilization of surfaces under windy conditions. • When hauling material and operating non-earthmoving equipment, prevent spillage and limit speeds to 15 miles per hour (mph). Limit speed of earth-moving equipment to 10 mph.
		IDOT's Standard Specifications address the containment and prevention of dust releases from the construction area. Specifically: *Standard Provision 107.36 Dust Control includes:*

#	Agency	Comment / Response (*in italics*)
		Engineer may require the implementation of dust control procedures if wind and dry soil conditions reduce visibility on adjacent roads and property. Concerns for health and safety to public using adjacent facilities will be grounds for engineer to request implementation of dust control plan. Control measures include: *Minimize track out of soil* *Reduce vehicle speed on un-paved surfaces* *Cover haul vehicles* *Apply dust suppressants* *IDOT can include more stringent requirements in a project special provision to further strengthen the contractor's Dust Control Plan as was employed on the special provision for Air Quality Compliance on the Monroe Street project meeting or exceeding air quality requirements. This special provision included an air quality plan, dust control plan, addressed diesel emissions, and response to incidents affecting integrity of work zone air quality. Specifically:* *Requirements for storage piles and disturbed areas: "The Contractor shall use the following methods to control dust and wind erosion of stockpiles and inactive areas of disturbed soil:* *Water shall be used during active stockpile load-in, load-out, and maintenance activities.* *Soil stabilizers (hydraulic or chemical mulch) may be applied to the surface of inactive stockpiles and other inactive areas of disturbed soil. Final grading and seeding of inactive areas shall occur immediately after construction activity is completed in an area and as directed by the Engineer.* *Plastic tarps may be used on small stockpiles, secured with sandbags or an equivalent method approved by the Engineer, to prevent the cover from being dislodged by the wind. The Contractor shall repair or replace the covers whenever damaged or dislodged at no additional cost."* *Note: The specifications do not require wind fencing but both the Standard Specification and Special Provisions require the use of water to control dust. In any case, the Contractor must provide a Dust Control Plan and have it approved prior to commencing any work.* *Hauling material. The Special Provision Construction Air Quality – Dust Control requires the following:* *"Control of Earthwork Dust. During batch drop operations the free drop height of excavated or aggregate material shall be reduced to minimum heights as necessary to perform the specified task, and to minimize the generation of dust. To prevent spills during transport, a minimum of 2 inches of freeboard space shall be maintained between the material load and the top of the truck cargo bed rail. A maximum drop height of two feet (or minimum height allowed by equipment) will be allowed, or to heights as directed by the Engineer."*
17	Westlake – US Environmental Protection Agency	Occupational Health • Reduce exposure through work practices and training, such as turning off engines when vehicles are stopped for more than a few minutes, training diesel-equipment operators to perform routine inspection, and maintaining filtration devices. • Position the exhaust pipe so that diesel fumes are directed away from the operator and nearby workers, reducing the fume concentration to which personnel are exposed. • Use enclosed, climate-controlled cabs pressurized and equipped with high-efficiency particulate air (HEPA) filters to reduce the operators' exposure to diesel fumes. Pressurization ensures that air moves from inside to outside. HEPA filters ensure that any incoming air is filtered first. • Use respirators, which are only an interim measure to control exposure to diesel emissions. In most cases, an N95 respirator is adequate. Workers must be trained and fit-tested before they wear respirators. Depending on the type of work being conducted, and if

#	Agency	Comment / Response (*in italics*)
		oil is present, concentrations of particulates present will determine the efficiency and type of mask and respirator. Personnel familiar with the selection, care, and use of respirators must perform the fit testing. Respirators must bear a NIOSH approval number.
		A Contractor's Site Health and Safety Plan is required by IDOT's article 669.06. The specification states: *"The Plan shall outline the procedures used to mobilize all required subcontractors in a timely fashion, and provisions to continue work in areas determined to be contaminated. "The plan shall also meet all requirements for the removal and disposal of non-special waste, special waste, or hazardous waste."* *The protection of construction workers and staff is the primary responsibility of the contractor. The responsibility is assigned in Article 107.28 Contractor Safety Responsibility in the Standard Specifications:* *"Contractor guarantees to the Department a safe work place shall be provided for all employees of the Contractor and each of its subcontractors. There shall be no violation by the Contractor or anyone working on the job of the applicable standards of the Occupational Safety and Health Act, or any other work place safety act of the State or the FHWA."* *Occupational health with respect to exposure to lead residues from bridge paint removal is regulated under OSHA – see GBSP 26* *Additional Department Standard Specifications applicable under this comment includes Article Std. 107.41 Construction Air Quality: Idling restrictions that indicates that trucks cannot idle for more than 10 minutes during a 60 minute period (subject to certain circumstances).*
18	Westlake – US Environmental Protection Agency	Community Outreach EPA notes IDOT/FHWA's continued commitment to meaningful public engagement throughout the NEPA process. Based on conversations held in November 2016, we understand IDOT/FHWA are considering hiring a community liaison during the construction and early phases of operation. We commend this approach and have several recommendations regarding the role of a community liaison to further address potential human health a11d environmental concerns, particularly during construction. Recommendations: If IDOT/FHWA ultimately hire a community liaison, we recommend a candidate with some community or public health experience. We recommend the community liaison be hired before construction begins. As discussed above, under Children's Health, a community liaison could coordinate the Air Quality Flag Program and other communication efforts, particularly with schools and childcare centers.
		The Department will work with all communities along the Project to explore funding options for a local construction liaison(s) through the Council of Mayors or other sources.
19	Westlake – US Environmental Protection Agency	The Draft EIS describes the existing website as a means to provide project information to the public and receive comments. Key project information is also provided in Spanish. It is unclear whether IDOT/FHWA intend to retain the website during construction and the early stages of operation. Recommendation: EPA recommends the website remain active during construction and early phases of operation. In addition to construction-related impacts (including anticipated duration, extent, and timing of emissions, noise, vibration, and accessibility), we recommend adding the above-referenced community liaison's contact information and bow impacted community members can ask questions or lodge complaints or concerns, particularly during the mainline construction phase. Any special or negotiated provisions (such as no construction within a certain distance of a school during school hours, as recommended above under Children's Health) or mitigation measures committed to in the ROD should also be included on the website.

#	Agency	Comment / Response (*in italics*)
		A project website will be maintained during design and construction to communicate design and construction activities and allow for public comment and input. The website will contain links to the FEIS that lists the environmental commitments.
20	Westlake – US Environmental Protection Agency	Final Design Elements EPA commends the following measures, which are part of the build alternatives. We recognize that many details regarding implementation will not be identified until the final design and implementation may rely on local funding or co-sponsorship. However, we encourage IDOTIFHWA to continue pursuit of these elements, which enhance the overall quality of the project and support meaningful public engagement. We commend the following measures, as they improve the overall quality of the human and natural environment within the project corridor. Recommendations: We recommend the continued coordination and ultimate incorporation of the following features into the ROD and final design, where appropriate. • The Draft EIS has outlined several sustainability measures proposed for implementation along the project corridor. Measures potentially include increases in green space and vegetated edging, as outlined in Section 3.1.6.2. IDOT/FHWA are also reducing flooding by incorporating improvements to local drainage systems, which include future storm sewer connections. The Village of Oak Park is considering solar gardens and solar panels on noise walls in conjunction with project construction. EPA commends each of these efforts and recommends continued coordination into final design. • EPA commends IDOT/FHWA's consideration of Context Sensitive Solutions (CSS), as detailed in Section 3.13.5.1. CSS features physical infrastructure designed with community input in terms of public art, texture, forms, themes, and colors. We recommend continued work with the community to improve the visual quality of the proposed infrastructure. In particular, we recommend considering public art along noise and retaining walls and under bridges (accessible to pedestrians and bicycles) to limit graffiti. • EPA commends IDOT/FHWA's commitment to Complete Streets provisions at interchanges. We also note incorporation of multi-modal features, such as bike lanes, pedestrian bridges at Home and Lavergne Avenues, and connections to the Illinois Prairie Path. EPA also notes the associated improvements to Chicago Transit Authority (CTA) infrastructure, including station access to arterial roads and bus stops. Continued coordination with CTA will ensure access is not impeded during construction, maintaining transit ridership. • IDOT/FHWA have coordinated with the Chicago Park District (CPD) to provide a shared use path to connect Austin Boulevard with Columbus Park. Design of the shared-use path also includes berms and landscaping, increasing the park's tree canopy. IDOT/FHWA have identified mitigation measures to replace existing or add new areas of landscaping and hardscaping, including placement of narrow planting strips along retaining walls or noise walls. EPA recommends use of native, non-invasive species along the corridor. • EPA commends the extensive and ongoing public outreach by the IDOTIFHWA project team. We recommend continued conversations with the impacted communities, particularly as details regarding noise walls, project design, and access emerge.
		Thank you for the recommendations.

RESPONSE TO COMMENTS – LOCAL GOVERNMENT COMMENTS

#	Agency	Comment / Response (*in italics*)
21	Orbon – Cook County Board of Commissioners	The existing sidewalk on Western Avenue bridge needs to be reconstructed to meet design standard and to provide ADA compliant ramps.
		Thank you for your input. Improvements to Western Avenue bridge over I-290, along with improvements to bridges over I-290 between Kostner Avenue and Racine Avenue are being evaluated as part of a separate, but parallel IDOT study. Your comment has been provided to that study team.
22	Orbon – Cook County Board of Commissioners	The traffic signals at the intersections of Western Avenue with West Congress Parkway and with West Van Buren Street should be modernized and outfitted with pedestrian countdown timers.
		Thank you for your input. Improvements to Western Avenue in the vicinity if I-290, along with improvements to bridges over I-290 between Kostner Avenue and Racine Avenue are being evaluated as part of a separate IDOT study. Your comment has been provided to that study team.
23	Orbon – Cook County Board of Commissioners	The Build alternative drainage improvement on I-290 would benefit the frontage roads by providing local flooding relief and specifically, the residential drainage/flooding issues due to undersized combined storm and sanitary sewer system.
		Thank you for your comment. Along with the I-290 drainage system improvements, frontage road drainage improvements are also planned along Harrison Street and Bataan Drive between 25th Avenue and 1st Avenue. These frontage road drainage improvements include a new oversized stormwater relief sewer that the Villages of Maywood and Broadview will be able connect to as part of future sewer separation projects.
24	Orbon – Cook County Board of Commissioners	Who will maintain the Noise Wall on Harrison street and Bataan Drive? This will be a discussion during design phase when the viewpoint solicitation process will be revisited.
		IDOT is responsible for 100% of the noise wall construction cost, and will maintain the structural integrity and expressway face of the walls. The Department requests that local entities assume maintenance responsibility (appearance) for the community face of the wall. As per IDOT's noise wall policy, a final decision with respect to the installation of noise abatement will be made during the Project's final design phase ("Phase II") and the public involvement process. Before the initiation of noise wall related work in Phase II, the Department and the Village will assess whether public sentiment has changed, either due to a substantial time lapse since the noise wall vote in 2016, or changes in noise wall technology or policy that alter the composition of the walls. If it is jointly determined that there is a change in public sentiment, a new vote that obtains the viewpoints of the benefited receptors will be held.
25	Cronin – DuPage County	As we understand, the HOT Lane concept being proposed is for operational purposes only. Through a variable pricing structure, motorists will be assured of a predictable and efficient travel option for in-bound/out-bound trips, at a cost. While DuPage County remains supportive of improvements that reduce travel times and increase reliability, we are concerned that our citizens will be disproportionately financially burdened. We look forward to continuing to participate in discussions to ensure equity for all users.
		That is correct, variable priced tolling is proposed to manage travel flow; we look forward to working with the county as this project moves forward.
26	Cronin – DuPage County	Recently, I and the other County Board Chairs from northeast Illinois co-signed a letter to USDOT Secretary Chao urging her support for increased transportation funding (not financing). Improvements to I-290 have been long over-due. Its importance in serving our

#	Agency	Comment / Response (*in italics*)
		regional economy cannot be overstated. I encourage IDOT to prioritize I-290 within its transportation funding program, including advance parallel arterial corridors such as Illinois 64, Illinois 38 and Illinois 56/Cermak, and as a State priority for federal funding assistance.
		Thank you for your comments; funding options will be developed and discussed in detail during Phase II (final design).
27	Cantore – Forest Preserve District of DuPage County	The Forest Preserve District of DuPage County would like to thank you for the opportunity to comment on the above mentioned project. At this time, the District has no comments or concerns and the project is entirely within Cook County and has no direct impacts to our preserves.
		Thank you for your comment.
28	O'Connor – Metropolitan Water Reclamation District of Greater Chicago	All MWRDGC facilities must be protected and 24-hour access provided during construction. We met with IDOT staff on November 6, 2015, and provided input to a preliminary design for routing our intercepting sewer under First Avenue. The design has subsequently been altered, and we will continue to work with you to ensure your project goals are met and all of our facilities are not impacted.
		Thank you for your comment.
29	O'Connor – Metropolitan Water Reclamation District of Greater Chicago	Section 3.7.1.3. There are some errors on Page 3-177 concerning CAWS water quality standards, as shown below: As of July 1, 2015, the South Branch of the Chicago River, as part of the Chicago Area Waterway System, has newly approved water quality standards (Title 35 Illinois Administrative Code, Part 302, Subpart D - Illinois Environmental Protection regulation). The Indigenous Aquatic Life stream use has been replaced with "Chicago Area Waterway System Aquatic Life Use A" standards. The South Branch Chicago River has specific dissolved oxygen and chloride water quality standards. From July 1, 2015 to July 1, 2018, the following applies: Chloride: 500 milligrams per liter (mg/L) (May 1 thru November 30); Total Dissolved Solids: 1,500 mg/L (December 1 thru April 30); and Dissolved Oxygen: minimum of 5.0 mg/L (March thru July); 4.0 mg/L daily minimum average over seven days; and 3.5 mg/L at any time (August thru February). After July 1, 2018, the water quality standard in effect for chlorides would be 500 mg/L and the Total Dissolved Solids water quality standard will be repealed.
		This modified text will be included in the FEIS.
30	O'Connor – Metropolitan Water Reclamation District of Greater Chicago	Section 3.9.2.3. Figure 3-58 should include a note that the new outlet pipe from First Avenue to the Des Plaines River would be designed to hold the 10-year frequency as shown in the areas directly to the west.
		This modified text will be included in the FEIS.
31	O'Connor – Metropolitan Water Reclamation District of Greater Chicago	Section 3.9.1.1 a. The last sentence of the second paragraph should state: "The reservoir is in the final design phase and is expected to be complete in three years (estimated completion in 2020)."
		This modified text will be included in the FEIS.
32	O'Connor – Metropolitan Water	Section 3.9.1.1.b. Add a sentence at the end of the third paragraph stating: "The channel improvements are in their final design phase and are expected to be completed in four years (estimated completion 2021)."

#	Agency	Comment / Response (*in italics*)
	Reclamation District of Greater Chicago	
		This modified text will be included in the FEIS.
33	O'Connor – Metropolitan Water Reclamation District of Greater Chicago	Section 3.9.2.1. After the paragraph on p. 3-197 that begins with "Longitudinal…", please add the following paragraph: "MWRDGC has been working with IDOT on the Addison Creek Reservoir and Channel Improvements projects. IDOT and MWRDGC staff met during MWRDGC's preliminary design phase, and more recently on July 26, 2016. Hey and Associates, Inc. continues to coordinate with IDOT. Also, MWRDGC has provided IDOT with modeling information." Questions may be referred to Joe Schuessler, Principal Civil Engineer, at (312) 751-3236.
		This modified text will be included in the FEIS.
34	Kaare – Village of Oak Park	Mr. Kaare stated that the Hulbert Historic District as show in the DEIS was not properly delineated. The Historic District extends east-west from Clinton Avenue to South Kenilworth Avenue but includes the houses on both sides of the street. The delineation in the DEIS only identifies the limit as extending from Clinton Avenue to S. Kenilworth Avenue but not the houses west of Clinton and east of Kenilworth. The correction to the limits will effect both the Section 3.0 Map Set (page 7 of 16) and the APE Limit exhibits (page 10 of 21).
		We have reviewed the Hulbert Historic District boundaries and have revised them to include both sides of Clinton Avenue and South Kenilworth Avenue. The revised boundaries are shown in the Section 3.0 FEIS/ROD map set and the APE map set in the Section 106 Effects Assessment Report in Appendix E.
35	McKenna – Village of Oak Park	The Village of Oak Park is formally requesting that the Illinois Department of Transportation extend the public comment period for the I-290 (Eisenhower Expressway) Draft Environmental Impact Statement (DEIS) for an additional 45 days. Please consider this request for an extension in time as the DEIS is a large document which requires a considerable amount of time to review and issue comment on.
		Comments received past the advertised deadline of February 13, 2017 were considered and have been addressed in this response to DEIS comments.
36	McKenna – Village of Oak Park	The Village of Oak Park has completed a review of the Draft Environmental Impact Statement (DEIS) for the I-290 reconstruction project and has no comments at this time. The Village of Oak Park has a Letter of Intent (LOI) with the Illinois Department of Transportation which confirms the Village's concurrence with the proposed improvement, defines cost participation responsibilities, and the maintenance/jurisdictional responsibilities for the project. Although no conflicts between the LOI and DEIS were found by staff during the Village's review of the DEIS, should the DEIS contain conflicts with the LOI, the DEIS should be revised to reflect commitments contained in the LOI.
		Thank you for your review and comments.

RESPONSE TO COMMENTS - PUBLIC ORGANIZATION COMMENTS

#	Public Organization	Comment / Response (*in italics*)
37	Burke – Active Transportation Alliance	The Active Transportation Alliance is a non-profit organization advocating for better biking, walking and transit. We are not anti-car, but we do think it's important to give people more and better non-auto options. We are pleased to present comments on the Eisenhower Expressway Draft Environmental Impact Statement (DEIS). Our comments are shaped by this reality: the region has seen a sharp increase in driving over the past 60 years, with a steep rise in the percentage of trips using motor vehicles vs. other modes. In fact, for most residents of the region, they rarely leave their homes without a car because that is often the only way to get to their destinations. More than 90 percent of all work trips originating in the suburbs are by car. It's no wonder, then, that our roads are so congested. The regional Go to 2040 Plan lays out a vision for reducing car dependency by increasing the use of transit and other non-auto modes. The plan comes up short, in our opinion, as full implementation would make a modest difference at best with our over-dependence on cars and the congestion, noise, expense, injuries, community disruption and economic inequity that go along with it. Making matters worse, Go to 2040 implementation has been heavily weighted towards roads and personal automobiles, which means the region isn't just doing too little but is actually moving in the wrong direction when it comes to regionally significant transportation projects. Projects completed or nearly completed include the Elgin O' Hare Expressway, Jane Adams Tollway widening, Jane Adams interchange, and the I-294/I-57 interchange, and the state is moving relatively quickly to add lanes to the Kennedy and Eisenhower expressways. Meanwhile, the transit agencies have struggled to fund basic maintenance and a handful of new stations, with little to no expansion in sight. It's no surprise that VMT is increasing and transit ridership decreasing recently, and the region lacks a meaningful vision for how to break from the status quo and give people - especially in the suburbs - better transportation options.
		Thank you for your comments.
38	Burke – Active Transportation Alliance	The Active Transportation Alliance is a non-profit organization advocating for better biking, walking and transit. We are not anti-car, but we do think it's important to give people more and better non-auto options. We are pleased to present comments on the Eisenhower Expressway Draft Environmental Impact Statement (DEIS). Our comments are shaped by this reality: the region has seen a sharp increase in driving over the past 60 years, with a steep rise in the percentage of trips using motor vehicles vs. other modes. In fact, for most residents of the region, they rarely leave their homes without a car because that is often the only way to get to their destinations. More than 90 percent of all work trips originating in the suburbs are by car. It's no wonder, then, that our roads are so congested. The regional Go to 2040 Plan lays out a vision for reducing car dependency by increasing the use of transit and other non-auto modes. The plan comes up short, in our opinion, as full implementation would make a modest difference at best in our over-dependence on cars and the congestion, noise, expense, injuries, community disruption and economic inequity that go along with it. Making matters worse, Go to 2040 implementation has been heavily weighted towards roads and personal automobiles, which means the region isn't just doing too little but is actually moving in the wrong direction when it comes to regionally significant transportation projects. Completed or nearly-completed regionally significant projects include the Elgin O' Hare Expressway/I-390 widening, Jane Adams Tollway widening, Jane Byrne interchange, and the I-294/I-57 interchange, and the state is moving relatively quickly to add lanes to the Kennedy, Eisenhower and Tri-State expressways and to extend I-390 east. Meanwhile, the transit agencies have struggled to fund basic maintenance and a handful of new stations, with little expansion in sight. It's no surprise that VMT is increasing and transit ridership decreasing recently, and the region lacks a meaningful vision for how to break from the status quo and give people better transportation options.
		Thank you for your comment.
39	Burke – Active Transportation Alliance	With this in mind, our main concern with the Eisenhower DEIS is that IDOT has selected an alternative that will spend billions of dollars while doing relatively little to reduce congestion within the corridor, a key component of the Purpose and Need, compared to doing nothing – the “No-Build "alternative. At the same time, the preferred alternative would increase the amount of driving in the region and

#	Public Organization	Comment / Response (*in italics*)
		the commensurate negative environmental, congestion, and safety impacts. Moreover, by further exacerbating car dependency and land use patterns that undermine non-auto modes, IDOT's preferred alternative makes it that much harder for people who cannot afford a car to get to work, school and other destinations. Each of these points are more important when one considers the cumulative impacts of the many highway expansion projects IDOT and ITHA are pursuing, rather than the Ike proposal in isolation as the DEIS does.
		The I-290 Eisenhower Expressway was constructed during the 1950s and is now beyond its useful service life and in need of reconstruction. Approximately 80% of the estimated construction cost for the Preferred Alternative is for the reconstruction of the existing facility. As documented in Section 5 Comparison of Alternatives Summary of the I-290 DEIS, the Preferred Alternative is also improving safety, reducing pollutant emissions, and reducing congestion as compared to the No Build Alternative. The I-290 Preferred Alternative includes three general purpose (no tolls) lanes in each direction (25% travel time improvement versus the No Build Alternative), and a HOT 3+ lane in each direction with vehicles having 3+ occupants and transit buses traveling for free (56% travel time improvement versus the No Build Alternative). The expressway and arterial travel time improvements represent sizable productivity savings. In addition, the Preferred Alternative includes wider bridge sidewalks that improve transit access to the Blue Line and improve community cohesion, and a new east-west bicycle path connecting the Prairie Path to Columbus Park.
40	Burke – Active Transportation Alliance	IDOT's study and the DEIS fail to comprehensively assess the regional transportation network, of which the Eisenhower is one component or segment, by considering a combination of travel demand reduction and transit strategies within and outside the study corridor that can achieve similar travel benefits within the corridor for far less cost, with less environmental impacts, and with fewer "upstream and downstream" impacts. Because the preferred alternative adds toll + carpool lanes in each direction, rather than converting existing lanes, it would lead to more driving compared to the No-Build according to IDOT modeling. This reinforces research and real world experience that shows adding highway capacity in congested metropolitan areas leads to more driving that erodes congestion benefits. Indeed, IDOT predicts 16.25 hours of congestion per day in the year 2040 compared to 18 hours per day with the No-Build, a small improvement, even though the new lanes would incentivize carpools of three or more people.
		A regional travel demand forecasting model was used to forecast future traffic for the I-290 Study. Regional transportation performance measures for the six-county northeast Illinois region, including regional vehicle miles of travel (VMT) and regional vehicle hours of travel (VHT) are included in the evaluation of the DEIS build alternatives, as presented in Table 5-2 Transportation Performance Comparison on page 5-13 of the I-290 DEIS. With regards to environmental impacts, an analysis area much larger that the I-290 study area was used for the Pollutant Burden and mobile source air toxics (MSAT) analysis, as shown in Figure 3-53 MSAT Analysis Area on page 3-133 of the I-290 DEIS. This air quality analysis area includes the "upstream and downstream" effects from improvements in the I-290 study area. I-290 is in a mature urban area and induced demand is addressed through the No Build and Build forecasts which show a relatively minor increase in traffic volume which show a relatively minor increase in traffic volumes. Also, the Preferred Alternative will generate over 4,000 more daily transit trips than the No Build Alternative by 2040. The HOT 3+ lanes would provide travel time savings of up to 56% and the remaining general purpose lanes would provide up to 25% time savings based on 2040 projections. The Preferred Alternative will also create $2.7B in productivity savings.
41	Burke – Active Transportation Alliance	In fact, under IDOT's preferred alternative, the vast majority of people traveling through the corridor will continue to use single occupancy vehicles that weigh thousands of pounds and are 80 percent empty. This is a wasteful use of public space but a very effective way to create traffic jams.
		The I-290 Preferred Alternative results in improved person throughput as compared to the No Build Alternative. The HOT 3+ lane encourages carpools with three or more occupants because these carpools would use the HOT lane for free. Transit buses will also benefit from free use of the HOT 3+ lane, which would be configured to operate at speeds of 45 mph or better.

#	Public Organization	Comment / Response (*in italics*)
42	Burke – Active Transportation Alliance	Nearby parallel surface streets are expected to see less traffic compared to the No-Build, but by stimulating additional driving within the Eisenhower corridor, on a regional level one would expect- and the IDOT modeling predicts - more driving on many of the surface streets and highways that people use to reach the Eisenhower along with commensurate increases in environmental impacts, traffic congestion, crashes and injuries. And by encouraging more driving, the preferred alternative will reinforce car-dependent development patterns across the region that undermine other, less environmentally harmful travel modes like walking, biking and transit.
		The Preferred Alternative is expected to result in a decrease of 8,853 vehicle miles of travel for study area arterials as compared to the No Build Alternative. However, regional VMT is expected to increase by 52,211, while regional VHT is expected to decrease by 16,161. This results in less regional traffic congestion, because less time is spent traveling in the region. As a result, the Preferred Alternative had lower air pollutant and mobile source air toxic emissions than the No Build Alternative. The Preferred Alternative also includes substantive multimodal improvements that will encourage alternatives to driving, such as a new east-west shared path connecting the Prairie Path to Columbus Park, new bus pull-outs, bus stops relocated to better align with the existing stations, new bus shelters, wider sidewalks, improved intersection cross-walks, pedestrian refuge islands, pedestrian phase signals, and pedestrian plazas.
43	Burke – Active Transportation Alliance	It's also worth noting that the safety benefits of redesigning the Eisenhower are undercut by the necessity to use narrower 11 foot lanes to accommodate additional car lanes. IDOT expects an increase in side swipe crashes because of the 11 foot lanes.
		This is a very constrained urban corridor with very limited space available for expressway widening and capacity improvements. The proposed shoulders and lane widths in the corridor address the needs to improve safety, operations, and mobility within the available right of way; the proposed design requires minimal ROW and results in no displacements. In some sections of the corridor, only the two inside lanes in each direction are proposed to be 11-feet wide, with the other 2 lanes in each direction at 12-feet wide, and all lanes 12-feet wide elsewhere Where the two inside lanes are 11-feet wide, they will be separated by a 2' painted buffer, so the overall width of the two lanes is 24-feet Overall, in the 9 mile reconstruction section, the Preferred Alternative will include 6 more miles of shoulders that are 10-feet wide or more, compared to existing conditions. Our analysis indicates that the configuration of the Preferred Alternative offers a 6.21% safety improvement compared to the existing design.
44	Burke – Active Transportation Alliance	Better utilization of the Blue Line should be a priority for any plan to improve travel in this corridor, but it's not a part of the preferred alternative even though IDOT committed to funding and planning for improvements to the CTA Blue Line and the Eisenhower Expressway as one project. Moreover, the Blue Line DEIS is many months behind the Eisenhower EIS.
		The Preferred Alternative includes improved pedestrian and bicycle access to the CTA Blue Line stations. IDOT will also reimburse CTA for direct impacts to their Blue Line station facilities because of the need to rebuild the bridges and widen the sidewalks. Also regional transit service would be improved through express bus services utilizing the proposed managed lanes to connect western origins/destination with the Blue Line CTA Terminal in Oak Park. Additionally, the proposed mainline improvements are configured to accommodate a future extension of the CTA Blue line to Mannheim Road in the median of I-290
45	Burke – Active Transportation Alliance	Finally, the introduction of autonomous vehicles and new mobility services could dramatically reduce VMT over time, making highway expansion an even worse investment. The IDOT study process and DEIS do not directly assess the potential effects of these game-changing innovations.
		The timeframe for market penetration and transportation impact of this technology is not known nationally. 2040 forecasts address reasonably foreseeable trends.

#	Public Organization	Comment / Response (*in italics*)
46	Burke – Active Transportation Alliance	In short, the Active Transportation Alliance believes the study process and the DEIS fail to 1. adequately account for the environmental, safety, and traffic impacts that spurring more driving will cause outside the study area because there is more driving associated with trips going to and from the corridor.
		The Preferred Alternative is expected to result in a decrease of 8,853 vehicle miles of travel (VMT) for study area arterials as compared to the No Build Alternative. However, regional VMT is expected to increase by 52,211, while regional VHT is expected to decrease by 16,161. This results in less regional traffic congestion, because less time is spent traveling in the region. As a result, the Preferred Alternative had lower air pollutant and mobile source air toxic emissions than the No Build Alternative. The Preferred Alternative also includes substantive multimodal improvements that will encourage alternatives to driving, such as a new east-west shared path connecting the Prairie Path to Columbus Park, new bus pull-outs, bus stops relocated to better align with the existing stations, new bus shelters, wider sidewalks, improved intersection cross-walks, pedestrian refuge islands, pedestrian phase signals, and pedestrian plazas.
47	Burke – Active Transportation Alliance	2. consider a better alternative, one that uses demand-side strategies to reduce driving and enhanced transit service within and connecting to the corridor. This approach can effectively address congestion (and the Purpose and Need more broadly) with far less expense and environmental impacts. IDOT should have evaluated such strategies beyond the current study area given that so many trips within the corridor start and end outside the study area.
		The Round 1 evaluation found that the transit alternatives, such as a Blue Line extension, bus rapid transit extensions, and express bus did not result in any travel performance improvement to I-290, primarily due to insufficient diversion from auto to transit due to their smaller, more compact travel market, as described in Section 2.3.3.1 of the I-290 DEIS. Existing regional TDM programs are assumed to be in place as part of this analysis.
48	Burke – Active Transportation Alliance	3. adequately assess the extent to which the preferred alternative would spur more driving outside the study area by undermining the viability of other transportation modes.
		The I-290 DEIS included the use of regional vehicle miles of travel and regional vehicle hours of travel as transportation performance measures (see Table 5-1. Comparison Matrix of Alternatives on page 5-6 of the I-290 DEIS) to ensure capture of travel impacts outside of the study area.
49	Burke – Active Transportation Alliance	4. adequately assess the extent to which people who cannot afford a car would be further disadvantaged because the preferred alternative reinforces car dependency across the region, and because low income residents are less able to afford the HOT lane tolls.
		An environmental justice analysis was conducted that found no disproportionate impacts to low income/minority communities (see Section 3.1.9 in the I-290 DEIS). Subsequent Phase II engineering and financial studies will determine the tolling policies and toll rate structure for the HOT lane. Page 3-102 of the I-290 DEIS discusses effects of tolling on low-income populations.
50	Burke – Active Transportation Alliance	With this in mind, our main concern with the Eisenhower DEIS is that, compared to the "No-Build" alternative, IDOT's preferred alternative will cost billions of dollars while doing relatively little to reduce congestion within the corridor - a key component of the Purpose and Need. At the same time, the preferred alternative would increase the amount of driving in the region and the commensurate negative environmental, congestion, and safety impacts. Moreover, by further exacerbating car dependency and land use patterns that undermine non-auto modes, IDOT's preferred alternative makes it that much harder for people who cannot afford a

#	Public Organization	Comment / Response (*in italics*)
		car to get to work, school and other destinations. Each of these points are more important when one considers the cumulative impacts of the many highway expansion projects IDOT and ITHA are pursuing, rather than the Ike proposal in isolation as the DEIS does.
		The I-290 Eisenhower Expressway was constructed during the 1950s and is now at the end of its useful service life and in need of reconstruction. Approximately 80% of the estimated construction cost for the Preferred Alternative is for the reconstruction of the existing facility. As documented in Section 5 Comparison of Alternatives Summary of the FEIS, the Preferred Alternative is also improving safety, reducing pollutant emissions, and reducing congestion as compared to the No Build Alternative. The I-290 Preferred Alternative includes three general purpose (no tolls) lanes in each direction (25% travel time improvement versus the No Build Alternative), and a HOT 3+ lane in each direction with vehicles having 3+ occupants and transit buses traveling for free (56% travel time improvement versus the No Build Alternative). The expressway and arterial travel time improvements represent sizable productivity savings estimated at $2.7B. In addition, the Preferred Alternative includes wider bridge sidewalks that improve transit access to the Blue Line and improve community cohesion, and a new east-west bicycle path connecting the Illinois Prairie Path to Columbus Park.
51	Burke – Active Transportation Alliance	Given that the Eisenhower is but one component or segment of a larger transportation system that moves people and goods to, from and within the corridor, and given that the highway is over-capacity largely because of excessive vehicle demand that originates outside the corridor, it is imperative that IDOT not limit its alternatives to supply-side strategies within the corridor. However, that is exactly what IDOT did. Alternatives presented by IDOT fail to include the application of demand-side strategies – also known as Transportation Demand Management (TDM) - inside or outside the corridor. According to Mobility Labs, "TDM has come into increased favor in the United States in recent years as planners have realized that it's much cheaper to proactively manage (or attempt to manipulate) the demand on a transportation network – or a system of roads – than it is to increase capacity on that same network."
		Transportation demand management (TDM) strategies are assumed in the modeling, and have been in existence in the region for many decades and have not demonstrated an ability to affect the need for major improvements. Pace operates both a regional RideShare and VanPool service. The transit agencies also do employer outreach that includes TDM strategies.
52	Burke – Active Transportation Alliance	Metro Chicago is far behind its peer regions in the use of employer-based incentive/transportation programs, carpool lanes and carpool bypass ramps, parking pricing and other TDM strategies. IDOT's alternatives also omit transit innovations like enhanced bus service to Blue Line and Metra stations and Transit Oriented Development incentives. TDM plus transit innovations could achieve similar benefits as IDOT's preferred alternative for far less cost, with less environmental impacts, and with fewer "upstream and downstream" impacts.
		Transit in this corridor has been extensively studied and evaluated as part of the I-290 study and by others. Fundamentally, the I-290 expressway and transit services serve two different travel markets, and as such stand-alone transit improvements would not result in any meaningful congestion relief along I-290. Stand-alone transit improvements, such as the extension of the Blue Line, did not result in any travel performance improvement to the I-290 Expressway (see Section 2.3.3.1 of the FEIS). In addition, 54% of the new ridership on a Blue Line extension would come from existing transit services; this indicates a lack of supportive land use. A heavy rail transit corridor will be preserved in the median of I-290 for a future extension of the Blue Line, and initially, an express bus service will operate in the managed lanes with connecting routes included (See Figure 5-2 in the FEIS). TDM strategies are assumed in the modeling. Although beneficial to managing traffic, TDM would not significantly contribute to congestion relief. The Preferred Alternative includes a HOT 3+ lane that would allow carpools with three or more occupants and transit buses to travel for free in the lane. The municipalities, rather than IDOT, control land use in the I-290 study area.

#	Public Organization	Comment / Response (*in italics*)
53	Burke – Active Transportation Alliance	Because the preferred alternative adds toll + carpool lanes in each direction, rather than converting existing lanes, it would lead to more driving compared to the No-Build according to IDOT modeling. (As already happened with the Elgin O'Hare/I-390, federal legislation would be needed to convert to tolled lanes; conversation to carpool lanes does not require legislation.) This reinforces research and real world experience that shows adding highway capacity in congested metropolitan areas leads to more driving that erodes congestion benefits. Indeed, IDOT predicts 16.25 hours of congestion per day in the year 2040 compared to 18 hours per day with the No-Build, a small improvement, even though the new lanes would incentivize carpools of three or more people.
		The Preferred Alternative actually does both -- it adds a new HOT 3+ lane between Mannheim Road and Austin Boulevard, and converts the existing fourth lane to a HOT3+ lane from Austin Boulevard to approximately Ashland Boulevard. This results in a continuous four lane section in each direction (rather than having a lane drop in each direction), resulting in safer operations and traffic congestion reduction. Regarding congestion, the Preferred Alternative will provide a 56% improvement in travel speed in the managed lane, and a 25% improvement in the general purpose lanes. Local arterials will also benefit from some congestion relief due to longer distance trips shifting from the arterial network onto I-290. The proposed improvement will improve safety, mobility for all users in the corridor and result in a $2.7B productivity savings.
54	Burke – Active Transportation Alliance	In fact, under IDOT's preferred alternative, the vast majority of people traveling through the corridor will continue to use single occupancy vehicles that weigh thousands of pounds and are 80 percent empty. This is a wasteful use of public space but a very effective way to create traffic jams
		The Preferred Alternative is projected to provide travel time savings of up to 56% and the general purpose lanes would provide up to 25% time savings based on 2040 projections. This indicates a reduction in congestion compared to the No Build Alternative. In addition, the HOT 3+ lanes will promote greater vehicle occupancy, as transit vehicles and automobiles with 3 or more occupants will not pay tolls and be assured of a reliable, toll-free trip at a minimum 45 mph travel speed in the HOT 3+ Lanes.
55	Burke – Active Transportation Alliance	Nearby parallel surface streets are expected to see less traffic compared to the No-Build, but by stimulating additional driving within the Eisenhower corridor, on a regional level one would expect - and the IDOT modeling predicts - more driving on many of the surface streets and highways that people use to reach the Eisenhower along with commensurate increases in environmental impacts, traffic congestion, crashes and injuries. And by encouraging more driving, the preferred alternative will reinforce car-dependent development patterns across the region that undermine other, less environmentally harmful travel modes like walking, biking and transit.
		On balance, the Preferred Alternative is projected to reduce arterial vehicle miles traveled (VMT) within the Study Area by 8,853 miles a day and arterial Vehicle Hours Traveled (VHT) within the Study Area by 1,643 hours a day. The reduction of traffic on surface streets is due to improved efficiency along I-290 that will draw longer distance trips off of the local roadway network. As with any transportation improvement, there are sections of supporting arterial roadways that experience projected gains and sections that experience projected losses as a result; however, the projected net reduction in both arterial VHT and VMT is a net benefit to Study Area travel. The Preferred Alternative also enhances bicycle and pedestrian modes by providing more user-friendly access across I-290 at all crossing locations and providing a new multi-use trail from Des Plaines Avenue to Austin Boulevard, providing connectivity between the Illinois Prairie Path and the trail at Columbus Park.
56	Burke – Active Transportation Alliance	It's also worth noting that the safety benefits of redesigning the Eisenhower are undercut by the necessity to use narrower 11 foot lanes to accommodate additional car lanes. IDOT expects an increase in side swipe crashes because of the 11 foot lanes.
		This is a very constrained urban corridor with very limited space available for expressway widening and capacity improvements. The proposed shoulders and lane widths of the Preferred Alternative address the needs to improve safety, operations and mobility within the

#	Public Organization	Comment / Response (*in italics*)
		available right-of-way; the proposed design requires minimal right-of-way and results in no displacements. Our analysis that utilizes the Highway Safety Manual's statistically based methodology indicates that the Preferred Alternative offers a 6.21% reduction in crashes as compared to the No Build Alternative. Overall, in the nine mile reconstruction section, the Preferred Alternative will include six more miles of shoulders that are 10 feet wide or more, compared to existing conditions.
57	Burke – Active Transportation Alliance	Better utilization of the Blue Line should be a priority for any plan to improve travel in this corridor, but it's not a part of the preferred alternative even though IDOT committed to funding improvements to the CTA Blue Line and the Eisenhower Expressway as one project. Moreover, the Blue Line DEIS is many months behind the Eisenhower DEIS.
		The Preferred Alternative includes improved pedestrian and bicycle access to the CTA Blue Line stations. IDOT will also address impacts to their Blue Line station facilities because of the need to rebuild the bridges and widen the sidewalks.
58	Burke – Active Transportation Alliance	Also note that FHWA recently changed its congestion rules, in which delay is measured in "person-hours" to better assess how well a corridor moves people instead of cars. Alternatives that include the Blue Extension would likely score better under this approach.
		The I-290 DEIS included the use of person throughput, which captured both highway and transit person trips, as a transportation performance measure (see FEIS Table 5-1, Comparison Matrix of Alternatives).
59	Burke – Active Transportation Alliance	Finally, the introduction of autonomous vehicles and new mobility services could dramatically reduce VMT over time, making highway expansion an even worse investment. The IDOT study process and DEIS do not directly assess the potential effects of these game-changing innovations.
		It is uncertain what the effect of autonomous vehicles will be in the future. In any case, improvements to the I-290 corridor, especially those that anticipate the use of smart vehicle technology such as Intelligent Transportation Systems (ITS) which will evolve over time, will make the corridor more efficient for autonomous vehicles as they become more widespread in use.
60	Burke – Active Transportation Alliance	In short, the Active Transportation Alliance believes the study process and the DEIS fail to: 1. adequately account for the environmental, safety, and traffic impacts that spurring more driving will cause outside the study area because there is more driving associated with trips going to and from the corridor.
		Environmental and traffic impacts were addressed in the DEIS on a regional level, and safety on a Study Area level including arterial roads as well as I-290. The increase in regional VMT of the Preferred Alternative over the No Build Alternative is insignificant at 0.03%. Most of the environmental impacts of the Preferred Alternative, such as traffic noise, floodplains, and Section 4(f) impacts, are limited to the area adjacent to I-290, and are not distinguishing differences as compared to the No Build Alternative. For regional air quality, there is also little difference in impact of the Preferred Alternative as compared to the No Build Alternative, with the Preferred Alternative having a slight reduction in the various air pollutants (-0.07% to -0.30%) and Mobile Source Air Toxics (-0.08% to -0.20%) as compared to the No Build Alternative.
61	Burke – Active Transportation Alliance	2. consider a better alternative, one that uses TDM to reduce driving (especially during peak hours) and enhanced transit service within and connecting to the corridor. This approach can effectively address congestion (and the Purpose and Need more broadly) with far less expense and environmental impacts. IDOT should have evaluated such strategies inside and outside the study area given that so many trips within the corridor start and end outside the study area.

#	Public Organization	Comment / Response (*in italics*)
		The Round 1 evaluation found that the transit alternatives, such as a Blue Line extension, bus rapid transit extensions, and express bus did not result in any travel performance improvement to I-290, primarily due to insufficient diversion from auto to transit due to their smaller, more compact travel market, as described in Section 2.3.3.1 of the FEIS. Existing regional TDM programs are assumed to be in place as part of this analysis.
62	Burke – Active Transportation Alliance	3. adequately assess the extent to which the preferred alternative would spur more driving outside the study area by undermining the viability of other transportation modes.
		The I-290 DEIS included the use of regional vehicle miles of travel and regional vehicle hours of travel as transportation performance measures (see FEIS Table 5-1, Comparison Matrix of Alternatives) to ensure capture of travel impacts outside of the study area.
63	Burke – Active Transportation Alliance	4. adequately assess the extent to which people who cannot afford a car would be further disadvantaged because the preferred alternative reinforces car dependency across the region, and because low income residents are less able to afford the tolled lanes.
		An environmental justice analysis was conducted that found no disproportionate impacts to low income/minority communities (see Section 3.1.9 of the FEIS). Subsequent Phase II engineering and financial studies will determine the tolling policies and toll rate structure for the HOT lane. Page 3-102 of the FEIS discusses effects of tolling on low-income populations.
64	Kuner – Citizens for Appropriate Transportation	Thank you for the opportunity to submit comments on the DEIS. Please accept our thanks for an enormous amount of work. We have grouped our comments into six categories: Purpose and Need, Alternatives, Impacts, Evaluation, Citizen Participation, and General Comments. 1. PURPOSE AND NEED a. IDOT's Goal IDOT should include their overall goal ("Create an asset for adjoining communities") in Chapter 1: Purpose and Need. To achieve this goal, both IDOT and the adjoining communities have important roles. The proposed IDOT and CTA investments in the Corridor are substantial, so they will have economic, social, and environmental impacts. The Chicago Metropolitan Agency for Planning Go To 2040 plan says most of our region's future growth should occur in existing communities. Community economic development efforts benefit from transportation investments. IDOT says, "any redevelopment of the land uses along the I-290 corridor is beyond the scope of this (or any) transportation project." Having IDOT do economic development is not appropriate, but having IDOT modify the design of the expressway to facilitate development is.
		The purpose and need was developed and refined over the course of multiple Corridor Advisory Group meetings and general public meetings. FHWA guidance indicates that the Purpose and Need statement should primarily focus on transportation problems to be solved. In addition, the stakeholder goals and objectives that were identified at the beginning of the NEPA process included community oriented goals, such as improving community cohesion. Please refer to section 5.5.1 of the FEIS for a description of how the Preferred Alternative addressed each of these goals and objectives. In terms of your suggested goal of "creating an asset for the communities", we believe this was achieved through the alternatives development process, which included extensive community interaction. For example, within the Village of Oak Park, an additional intensive 18 month process was undertaken toward the end of the NEPA process to discuss every issue of concern to the community, which the project team has relied upon to gauge whether a community asset has been created. With respect to modifying the project design to facilitate development, the alternatives development and stakeholder involvement process was the forum for any specific design changes related to development, and any specific suggestions that were offered were considered and incorporated as appropriate.

#	Public Organization	Comment / Response (*in italics*)
65	Kuner – Citizens for Appropriate Transportation	b. Livability IDOT should include livability features in the Purpose and Need Statement. Pennsylvania DOT and New Jersey DOT include livability features in their projects.
		The purpose and need was developed and refined over the course of multiple Corridor Advisory Group meetings and general public meetings. FHWA guidance indicates that the Purpose and Need statement should primarily focus on transportation problems to be solved. The livability issues caused by current conditions along the I-290 corridor are documented in the Purpose and Need as well as the Existing Conditions Technical Report. The concept of livability was defined during the development of alternatives and the stakeholder feedback received. Within the context of a FHWA NEPA study, livability elements that are consistent with the Preferred Alternative include: providing more travel choices (carpooling, transit, non-motorized improvements), enhancing economic competitiveness (productivity savings), supporting and value existing communities (avoid direct impacts, design improvements, aesthetic features), and coordinating policies and leveraging investment (I-290 project leverages CTA improvements).
66	Kuner – Citizens for Appropriate Transportation	2. ALTERNATIVES Good solutions are multi-modal for both Traditional and Reverse Commutes. They create a better economic climate that will encourage investments in our communities. They meet social goals. They reduce negative impacts on the environment. They increase the livability of our communities. They make financial sense. a. Capacity IDOT's Preferred Alternative will not have enough capacity to eliminate congestion. The CTA Forest Park Branch has excess capacity. The more people who choose transit over driving, the less congestion on the expressway and the more revenue for the CTA. For every rider on the Forest Park Branch of the CTA Blue Line, there are 2.5 to 2.7 riders on the O'Hare Branch, so there is unused capacity on the Forest Park Branch (see Figure 1). Driverless cars and crash avoidance systems may increase expressway capacity, but when and by how much is uncertain. The CTA already transports Captive Riders (no access to a car), but needs to attract more Choice Riders (access to a car, but choose transit). Hours of Congestion – IDOT's prior analysis shows that weekday congestion on the existing general purpose lanes is about 17 hours a day, which is projected to be 18 hours a day by 2040 under the 2040 No Build Alternative. Of the four Build Alternatives IDOT considered, the best one would reduce this to 16¼ hours on a weekday for the general purpose lanes. For the HOT 3+ lanes, IDOT's analysis shows lower congestion levels. These numbers do not appear in the DEIS. Why did IDOT exclude them? Four of the eight lanes in the Preferred Alternative are 11 feet wide even though the interstate standard is 12 feet. The other four lanes are 12 feet wide. Eleven foot lanes tend to increase sideswipe accidents. IDOT's approach is to look at the impact of all design features on crashes and accept a higher crash rate for 11 foot lanes if there are design features that lower the crash rate elsewhere.
		The CTA Forest Park Branch of the Blue Line and the I-290 corridor have differing travel markets, and therefore, the expectation of a significant mode shift would not be reasonable. In addition, the extensive testing of alternatives and operational strategies revealed that a significant mode shift could not be achieved. With respect to the hours of congestion, this information is included in the Round #2 evaluation (see "Summary of Round 2 Combination Mode Evaluation Results" in Appendix C of the FEIS). For the Round #3 evaluation, the transportation related criteria was consolidated and new criteria related to the environment and cost was introduced. Regardless of whether the hours of congestion were included in Round #3, the relative comparison would have been the same. In addition, other measures, such as travel time improvements, were more readily understood by stakeholders, and better describe the benefits of the Preferred Alternative, which includes a 56% travel time savings in the HOT 3+ lane.
67	Kuner – Citizens for Appropriate Transportation	b. Crashes The expressway section under study has about 2,500 crashes a year while the CTA has zero crashes in most years. This makes the CTA a desirable and viable option assuming a reduction in the number of pickpocket, theft, and robbery incidents.

#	Public Organization	Comment / Response (*in italics*)
		In the assessment of alternatives in Rounds 1, 2 and 3, public transit was assumed to account for zero crashes (see Sections 2.3.3, 2.4.2 and 2.5.3 of the FEIS).
68	Kuner – Citizens for Appropriate Transportation	c. Blue Line Role Good transit service means a better quality of life for families without cars, young children, and senior citizens. The CTA Forest Park Blue Line branch can carry many more commuters with less negative impacts than widening the expressway. Transit needs dense development to function effectively. The inner West Cook County suburbs have the necessary density. Recent development trends suggest density on Chicago's West Side will increase in the future, providing additional demands for CTA rail service. Requiring transit-oriented development around stations will help transit and land use work better. Zoning codes that allow transit-appropriate density within walking distance of stations is another good policy. The Blue Line extension will have more riders if it includes large park-and-ride lots, feeder bus service to the stations, kiss-and-ride, and bicycle racks or storage lockers. A pricing structure that encourages the use of park-and-ride or feeder bus as an alternative to driving into downtown Chicago will also help. The CTA should extend the Blue Line to at least 1st Avenue in Maywood. Not extending the Blue Line west of Forest Park will mean more expressway congestion and it hurts Maywood. The CTA already owns the right-of-way from the Forest Park Yards to the east side of the Des Plaines River. The further west the CTA intercepts drivers via Park-and-Ride facilities, the better because that will reduce the number of vehicles on the expressway. The CTA schedule for the Blue Line has 4 to 9 minute headways during peak periods. The CTA's signal system can handle headways of less than four minutes. The CTA is not extending it because other projects have higher priority and the lack of funding. For IDOT, reconstructing and widening the expressway in the six-lane section is a priority. For the CTA, rebuilding the existing Forest Park Branch of the CTA is a priority; extending the Blue Line is not. Because of different priorities and funding programs, it is possible IDOT will improve the expressway years before any extension of the Blue Line takes place. Corridor residents and businesses may not see the full benefits from multi-modal planning for years
		The Blue Line extension was studied in depth, with assumptions regarding stations, service frequency and park and ride locations (FEIS Section 2.4.5.3). The analysis found that 54% of the ridership would be from other existing transit services, which indicates that there is currently a lack of supportive land use to justify a heavy rail extension. A heavy rail transit corridor will be preserved in the median of I-290 for a future extension of the Blue Line, and initially, an express bus service will operate in the managed lanes. Comments regarding pricing structure was passed along to CTA staff
69	Kuner – Citizens for Appropriate Transportation	d. CSX Right-of-Way The CSX railroad says none of their right-of-way is available, which means higher bridges at Austin and Harlem and four 11 foot lanes. There is a provision in the Letter of Intent between IDOT and the Village of Oak Park to reopen this issue if some of the CSX right-of-way becomes available, but this is not mentioned in the DEIS.
		The proposed profiles of all the bridges in Oak Park, including Austin Boulevard and Harlem Avenue, will remain at or below their existing elevations, and none will be higher. The Oak Park LOI does includes language that states that IDOT will re-evaluate the vertical clearance requirements of the overhead bridges across I-290 in Oak Park by IDOT if the CSX ceases operations or if other changes occur that would allow a less than 21'-9" vertical clearance over the railroad. The LOI's for all Villages and agencies are available in Appendix Q of the Combined Design Report. The FEIS is revised to include language indicating that re-evaluation in case of changed conditions at CSX.
70	Kuner – Citizens for Appropriate Transportation	e. HOT 3+ Experience HOT lanes are hard to manage. They have five purposes: (1) decrease travel time, (2) increase the person capacity of an expressway, (3) increase trip reliability, (4) decrease air pollution, and (5) increase revenue. To use HOT 3+ lanes, the driver must find two more people, pick them up, and drop them off at convenient locations. People who work late or irregular hours, use their cars during the day,

#	Public Organization	Comment / Response (*in italics*)
		park free at work, have young children or aging parents, or who run errands during their commute, are less inclined to car pool. The extra time required picking up and dropping off extra people reduces travel time savings. Too much traffic means motorists do not get the promised travel time reduction. Too little traffic wastes roadway capacity. Some projects have not met revenue projections. The major equity questions are: (1) do agency polices treat people in the same group equally, (2) do users pay the full cost, (3) do low-income groups pay a disproportionate share, (4) do tolls cause drivers to divert to neighborhood streets, and (5) are there better alternatives?
		The high occupancy toll (HOT) lane in the Preferred Alternative is proposed to have a toll rates that vary with the level of traffic congestion (dynamic pricing). Subsequent Phase II engineering and financial studies will determine the tolling policies and toll rate structure for the HOT lane. These studies will address the first three equity issues raised. The fourth equity issue cited regarding diversion to arterial streets is addressed in the transportation performance measures in Table 5-1 of the FEIS (Comparison Matrix of Alternatives) depicts study area arterial vehicle miles and hours of travel for build alternatives as well as the No Build Alternative. The Preferred Alternative is projected to reduce arterial vehicle miles traveled within the Study Area and to reduce regional vehicle hours traveled. FEIS Section 5.0 Comparison of Alternatives Summary addresses the fifth equity issue raised regarding alternative selection.
71	Kuner – Citizens for Appropriate Transportation	f. Development Opportunities When properly designed, major transportation improvements have positive effects on social, economic, and environmental conditions in the corridor. Major roadways provide mobility for people and goods. Mobility clearly affects the choices we make about where to live, work, shop, and carry out other activities. “Transportation decisions cannot be separated from community values and public policy. The point of CSD (Context-Sensitive Design) is to satisfy not just the user of the road, but also the community it impacts. A roadway must be safe for both the user and the community; be in harmony with the community; and preserve environmental, scenic, aesthetic, historic, and natural resource values of the area. It should cause minimal disruption and add lasting value to the community.”3 IDOT’s Build Alternatives create development opportunities. The Envision Oak Park Comprehensive Plan identifies eleven Transit Area Housing Development Opportunity sites along the corridor.
		Thank you for your comment.
72	Kuner – Citizens for Appropriate Transportation	g. Design A good design for the Eisenhower Corridor must address the needs for all transportation modes, add value to the adjacent communities, and be compatible with the built and natural environments. Every transportation mode (expressway, rail transit, buses, pedestrians, and bicyclists) plays a role. When each mode is designed to do what it does best, the transportation system works better and is efficient. One fundamental principle of transportation is good design is always better than good enforcement or regulation. Good design is there 24/7. Good enforcement cannot be there 24/7. The design of corridor edges is critical because both residential and non-residential uses are close to the Corridor. The fact that neighbors in Oak Park built the wood fence on Harrison from Grove to Wenonah along the northern edge of the expressway more than twenty-five years ago is powerful evidence of the importance of corridor edge design. Neighbors have maintained and replaced sections as needed. IDOT’s proposed shoulder widths are substandard, putting police, fire/paramedics, and motorists at risk. Context Sensitive Solutions - IDOT is following a Context Sensitive Solutions process for the Phase 1 Study, but there has never been a presentation from either an urban designer or architect at any of the Corridor Advisory Group/Task Force meetings.
		IDOT has sought the input, and will continue to seek the input, of the various municipalities when considering the edges or interfaces along the I-290 frontage, including the proposed multi-use path, location and appearance of proposed noise walls, and other project appurtenances. With the numerous municipal planners' input, as well as stakeholders and study team members who are urban

#	Public Organization	Comment / Response (*in italics*)
		designers or architects contributing to the project, it is not apparent that the study suffered specifically from lack of a presentation by an urban designer or architect.
73	Kuner – Citizens for Appropriate Transportation	h. Demand Management and Congestion Pricing Using a combination of demand management techniques can have a significant impact. Individual techniques to reduce demand have a limited impact, but in combination, they can have a significant impact. Some of these techniques are flextime, car and vanpools, working at home, and staggered work hours.
		Transportation demand management (TDM) strategies are assumed in the modeling, and have been in existence in the region for decades, but have not demonstrated an ability to affect the need for major improvements.
74	Kuner – Citizens for Appropriate Transportation	i. Interchanges IDOT's proposed right side ramps at Austin and Harlem are longer, higher, and closer to residential neighborhoods than the current center ramps. Right-hand side ramps will have negative air and noise impacts, and can hurt property values. Motorists who want to use the HOT 3+ lanes will enter the expressway on right side ramps and cross three lanes to get to the HOT 3+ lanes. This is likely to increase the accident rate.
		IDOT performed extensive air and noise evaluations with respect to the proposed design of the right hand ramps and coordinated these studies with the Village of Oak Park, Forest Park, and the Corridor Advisory Group. With respect to noise, IDOT performed noise sensitivity evaluations at both Harlem Avenue and Austin Boulevard that compared existing to proposed noise conditions. In both locations, the proposed design indicated there would either be no increase in noise levels or some reduction in noise levels near the expressway (without noise walls). The predominant noise source is the expressway, which operates approximately 200,000 vehicles per day, compared to ramp traffic which is approximately 11,000 vehicles per day. By moving the ramps to the right, the ramps themselves shield the community from the expressway traffic noise. To evaluate air quality effects, a carbon monoxide evaluation (CO) was performed at Harem Avenue and Austin Boulevard for the build condition. The analysis indicated that the CO concentrations for the build conditions fell far below the National Ambient Air Quality Standards (NAAQS) for both the 1-hour and 8-hour standards. *With respect to accident rates, the crash analysis in this corridor has found that documented crash rates are sustainably higher at the left hand ramps as compared to right hand ramps (refer to the I-290 Combined Design Report, Section 3.4.2.4 – Existing Lane Drops and Left Hand Ramp Safety), and national studies have found that left hand ramps are 60% to 180% less safe than right side ramps. Left hand ramp exits and entrances are contrary to driver expectations, and the inside highway lane (left-most lane) is typically for longer distance, higher speed travel. Configuring all ramps in the corridor to right hand ramps will provide consistency along the corridor while improving safety and operations. Furthermore, the HOT 3+ lane will be continuously accessible through the majority of the corridor, therefore users will not be limited in the distance or time needed to safely access the managed lane.*
75	Kuner – Citizens for Appropriate Transportation	j. Diversion of Traffic to Local Streets Alternatives with tolls divert traffic to neighborhood arterial streets as drivers seek to avoid paying to use the expressway.
		According to the performance comparison (Table 5-2 of the FEIS), both the GP Lane Alternative (which doesn't have tolling) and the HOT 3+ and TOLL Alternative (which applies tolls to non-HOVs in the HOT lanes) would reduce vehicle miles traveled (VMT) on Study Area arterials. The Preferred Alternative (HOT 3+) is projected to reduce arterial vehicle miles traveled within the Study Area and to reduce regional vehicle hours traveled.
76	Kuner – Citizens for Appropriate Transportation	3. IMPACTS a. Air Quality

#	Public Organization	Comment / Response (*in italics*)
		The air quality analysis is incomplete. IDOT should update it in Phase 2: Working Drawings and Specifications. IDOT says, • "According to this analysis, the build alternatives would have minimal effects on regional criteria pollutant burdens, with changes of less than one percent, as compared to the No Build Alternative. "Comments of the Draft Environmental Impact Statement - February 10, 2017 Citizens for Appropriate Transportation – Rick Kuner - Page 6 of 12 • "… the USEPA has classified the portion of Cook County in which the proposed project is located as a nonattainment area for O3 and has designated the entire state as unclassifiable for the 2012 PM2.5 NAAQS."6 • "For the eight-hour ozone standards, Cook, DuPage, Kane, Lake, McHenry, and Will counties, as well as Aux Sable and Goose Lake townships in Grundy County and Oswego Township in Kendall County, have been designated as nonattainment areas for ozone."7 • "In FHWA's view, information is incomplete or unavailable to credibly predict the project-specific health impacts due to changes in MSAT8 emissions associated with a proposed set of highway alternatives. The outcome of such an assessment, adverse or not, would be influenced more by uncertainty introduced into the process through assumption and speculation rather than any genuine insight into the actual health impacts directly attributable to MSAT exposure associated with a proposed action."9 • "The methodologies for forecasting health impacts include emissions modeling; dispersion modeling; exposure modeling; and then final determination of health impacts with each step in the process building on the model predictions obtained in the previous step. All are encumbered by technical shortcomings or uncertain science that prevents a more complete differentiation of the MSAT health impacts among a set of project alternatives. These difficulties are magnified for lifetime (i.e., 70 year) assessments, particularly because unsupportable assumptions would have to be made regarding changes in travel patterns and vehicle technology (which affects emissions rates) over that time frame, since such information is unavailable. "The "Air Pollution Action Day History" prepared by Partners for Clean Air – Illinois (c/o Illinois EPA, www.clearntheair.org) shows that in the seven years from 2010 to 2016, the year with the highest number of Action Days was 2012 (12 days) and the year with the lowest number was 2015 (zero days). There were 12 Action Days for ozone in 2012 and 3 Action Days for Fine Particulates in 2010. The DEIS says Fine Particulates (PM2.5) are "unclassifiable" for the entire state of Illinois. Because Fine Particulates are a health problem, this is of concern. Based on a conversation with U.S. Environmental Protection Agency personnel, our understanding of the "unclassifiable" classification is the Cook County laboratory found that the sample filters with monitors were outside specifications. Because the U.S. EPA does not have the data to make a determination, they say Fine Particulates are "unclassifiable" for the entire state of Illinois. The problem with the sample filters was corrected in mid-2016, but the U.S. EPA needs three years of data to compare, so they will not be able to make a determination until mid-2019. The Fine Particulate standard was last set in 2012. Because of unacceptable monitoring data, the U.S. EPA was unable to assess compliance with the 2012 standard. Standards must be reviewed every five years, so the U.S. EPA would revise the standard (if necessary) in 2017. By the time IDOT starts construction, estimated to be 2020, there may be a new Fine Particulate Standard.In the DEIS, IDOT says, "Regardless, on a regional basis, USEPA's vehicle and fuel regulations, coupled with fleet turnover, will over time cause substantial reductions that, in almost all cases, will cause region-wide MSAT levels to be substantially lower than today."11 Given IDOT's estimate that construction will not start earlier than 2020, updating the air quality analysis would provide better conclusions than expressed in the December 2016 Draft Environmental Impact Statement.
		Any potential change that the USEPA would make to the fine particulate standard is unknown at this time. However, it should be noted that the I-290 Eisenhower Expressway is not a heavy truck freight corridor in the study area. Existing and estimated year 2040 traffic projections on I-290 show existing truck traffic increasing from approximately 10,000 per to 12,000 per day, or 6 percent of total traffic. This relatively small change in diesel truck usage would not result in a new violation of air quality standards. Coordination with USEPA was also conducted as part of the region's consultation group, where discussions indicated that the I-290 project would not be a project air quality concern because there is little change in diesel truck traffic with the project, comparing it to the no-build scenario. With regard to the MSAT analysis, the current USEPA state-of-the-practice air quality model, MOVES 2014, was used to estimate MSAT emissions for the alternatives, with the Preferred Alternative showing reductions in MSAT emissions as compared to the No Build

#	Public Organization	Comment / Response (*in italics*)
		Alternative. Given the projected reduction in MSAT emissions of the Preferred Alternative, and that there will be substantial overall reductions in MSAT emissions over time to vehicle and fleet regulations and fleet turnover, any further MSAT analyses are not warranted.
77	Kuner – Citizens for Appropriate Transportation	b. Noise Walls Because of changes in noise wall materials, IDOT agreed to Oak Park's request to conduct another vote on whether eligible voters want or do not want noise walls.
		A final decision with respect to the installation of noise abatement will be made during the Project's final design phase ("Phase II") and the public involvement process. Before the initiation of noise wall related work in Phase II, the Department and the Village will assess whether public sentiment has changed, either due to a substantial time lapse since the noise wall vote in 2016, or changes in noise wall technology or policy that alter the composition of the walls. If it is jointly determined that there is a change in public sentiment, a new vote that obtains the viewpoints of the benefited receptors will be held.
78	Kuner – Citizens for Appropriate Transportation	c. Property Values The evidence on the impact of expressways on property values is mixed. IDOT says its proposals "stay within the ditch." However, the ditch has three dimensions – width, height, and length. IDOT's proposed Build Alternatives stay within the width of the ditch in Oak Park, but do not stay within the height of the ditch at the Austin and Harlem Interchanges.
		With the Preferred Alternative, the mainline roadway will be as much as 8 feet lower than it is today, and the CSX railroad will be lowered up to 2 feet. The proposed profiles of all the bridges in Oak Park, including Austin Boulevard and Harlem Avenue, will remain at or below their existing elevations. The design of the interchange ramps, in conjunction with mainline lowering, is predicted to result in some noise reductions as compared to the noise in the interchanges' current configuration.
79	Kuner – Citizens for Appropriate Transportation	d. Neighborhood Impacts What happens to property values during and after construction? Ideally, the project improves social and visual connections between South Oak Park and the rest of the Village. It should provide safe school walking routes from South Oak Park to both middle schools (Brooks and Julian) and the Oak Park River Forest High School, which are north of the expressway.
		Property values are subject to many factors, including the local and national economy, location, condition of the property, local schools, perception of safety, and other factors. It is uncertain what effect the I-290 expansion will have on property values during and after construction; however, there are many proposed improvements that would suggest a favorable environment for property values including wider bridges, new CTA head houses and improved access to transit, a new shared use trail, and brand new bridges with aesthetic treatments that are being coordinated with the Village.
80	Kuner – Citizens for Appropriate Transportation	e. Sustainability We are pleased IDOT used the INVEST Sustainability Scorecard in the DEIS. We note the Bronze Rating and your belief that you can achieve Platinum status during the Working Drawings and Specifications phase.
		The INVEST opportunities noted in Appendix M will be further pursued in the project's final design phase ("Phase II").
81	Kuner – Citizens for Appropriate Transportation	f. Construction Impacts There was damage to the UIC's CUPPA building when IDOT reconstructed the Morgan Street Bridge. In Oak Park, there are many buildings close to the expressway, some of which are fragile (the Oak Park Conservatory, for example), so the effects of ground vibration are a major concern. The Citizens for Appropriate Transportation Working Group suggested four actions: (1) video / photograph documentation of building foundations, doors, and windows prior to construction, (2) an insurance rider added to the homeowner's policy, (3) dispute resolution by binding arbitration, and (4) use construction contract retainage to settle damage claims. Additional construction measures worth considering are the location of staging areas, possible nighttime construction, noise and air

#	Public Organization	Comment / Response (*in italics*)
		pollution, alternative routes, and staged construction. Good communication between IDOT and the communities is mandatory. During construction, IDOT, CTA, and Oak Park should consider shuttle bus service to the Green Line Stations when Blue Line Stations are rebuilt, parking restriction changes, discount fares on the Blue Line, and improvements to local streets because traffic will be diverted to them during construction.
		In Phase II and Phase III, IDOT is committing to work with the local communities and stakeholders to develop and implement strategies to reduce construction effects. This will include development of specifications to address noise, dust, time of work, and materials storage within the context of the community. Also, IDOT will coordinate with the communities to develop a scope of work for an overall monitoring program to address vibration/settlement concerns. However, the execution of the program, beginning with condition surveys of buildings, would not be initiated until closer to the time of construction.
82	Kuner – Citizens for Appropriate Transportation	4. EVALUATION a. Impact Scores are projections to the Year 2040 Table 1 summarizes the Number of Transportation Criteria that equal or exceed seven different percentages (50, 40, 30, 20, 10, 5, and 1). IDOT used ten transportation criteria but the Year 2040 No Build Alternative does not have managed lanes, so there are only nine criteria where it is possible to calculate the percentage improvement of the Build Alternative compared to the No Build Alternative. There are only four criteria where the Preferred Alternative (HOT 3+) is better than the No Build Alternative by five percent or more. IDOT's Preferred Alternative will affect the region and the communities in the Eisenhower Corridor for the next five or six decades. IDOT's recommendation of the HOT 3+ Alternative is based on many small differences in impact scores. Projections to the Year 2040 are unlikely to be accurate, especially given the rapid social and technological changes taking place. It concerns us that the expenditure of such a large sum will result in such a small improvement in performance.
		With respect to your comment about the differences in impact scores, NEPA does not prescribe performance thresholds; instead, a series of relative comparisons are made between a no build and build scenarios. The year 2040 forecasts were developed using state of the practice methodologies, and the long range forecasts are revised every 4 years, and account for reasonably foreseeable technologies and trends. It is also important to note that a reconstruction of I-290 is warranted based upon facility condition alone, and 80% of the reconstruction cost is simply to replace the existing facility.
83	Kuner – Citizens for Appropriate Transportation	b. The Travel Demand Models have limitations even with IDOT's enhancements. The dollar value of travel time varies widely among drivers and depends and on how important it is to the driver to be at their destination by a given time. IDOT will have to set tolls high enough to reduce congestion. Toll levels will also have an impact on the general purpose lanes as well as alternative routes on arterial and local streets. Drivers can change routes, take the Blue Line, reschedule trips, and move or change jobs. Reliability is also important. IDOT's efforts to provide real-time information to motorists will also help. Accounting for trends is difficult because they change over time. There are a wide-ranging set of possible trends listed in Table 2 to illustrate this point. IDOT did not use the Chicago Metropolitan Agency for Planning's Go To 2040 Policy-Based Forecasts. IDOT assumes more development in the outlying suburbs, while CMAP assumes more development in existing communities. In his ruling on the proposed Illiana Expressway that remanded the Environmental Impact Statement and the Record of Decision to IDOT, Indiana Department of Transportation, and the Federal Highway Administration, Judge Alonso said, "it would seem unwise" to reject the Policy-Based Forecasts. By using a Market-Based Population and Employment Forecast, IDOT's Preferred Alternative could undermine CMAP Recommendations in the Go To 2040 Plan.
		The I-290 forecasts are within 1% of the CMAP forecast in the study area. With respect to undermining the CMAP recommendations in the transportation component of the 2040 plan, it is important to note that adding a managed lane to I-290 is part of the 2040 plan.

#	Public Organization	Comment / Response (*in italics*)
84	Kuner – Citizens for Appropriate Transportation	c. Ordinal – Ratio Scale Problem We raised this issue in our letter to IDOT dated June 19, 2012. IDOT's response was to develop a better evaluation process using Ratio Scales. Using Ordinal Scales to evaluate the Build Alternatives and compare them to the No Build Alternative is not statistically valid. When IDOT states that both evaluation methods lead to the same Preferred Alternative, you are giving a false impression. We think IDOT should delete the Ordinal Scale evaluation and just use the Ratio Scale evaluation.
		Both Ordinal and Ratio scoring provide a valid basis for comparing alternatives against each other. The results of both scoring methods remain in the FEIS, in particular to demonstrate that the results are similar when scored both ways.
85	Kuner – Citizens for Appropriate Transportation	d. Scenario Planning Scenario Planning considers alternative futures and their impacts. Forecasts for the Year 2040 may not be accurate. Scenario Planning would help IDOT account for different futures. Making a multi-billion dollar investment in the expressway based on future projections is risky. Forecasting is imperfect, so IDOT should analyze several different scenarios. By considering plausible scenarios, IDOT would reduce their risk.
		It is important to note that the reconstruction of I-290 is warranted based upon facility condition alone; in large measure, the project need is being driven by existing conditions. At this time, there is no evidence that future trends are emerging that would significantly change the level of travel in the corridor. Nationally, VMT is at an all-time high.
86	Kuner – Citizens for Appropriate Transportation	e. Sensitivity Analysis Sensitivity analysis examines the extent to which changes affect the results. Given two Build Alternatives with small differences among impact scores, the recommendation for one over the other includes language that says it would not take much change to stop recommending one alternative and start recommending the other. In contrast, given two Build Alternatives with large differences among impact scores, the recommendation is much stronger because it would take a large margin of error before we would stop recommending one and start recommending the other. Small differences among alternatives for the Year 2040 reinforce the need to do Scenario Planning and Sensitivity Analysis.
		The four DEIS build alternatives are practically identical in terms of the expressway physical footprint and characteristics, and transit improvements. The major difference in the alternatives is how the expressway lanes are managed (general purpose, HOV, HOT) and the resulting traffic differences and the potential for toll revenue. Given the current demand already exceeds the expressway capacity, changing the level of 2040 demand through a sensitivity analysis is (for example, assuming gas prices are relatively higher or lower in the future) is not likely to affect the ranking of alternatives or the selection of the Preferred Alternative.
87	Kuner – Citizens for Appropriate Transportation	5. CITIZEN PARTICIPATION a. Forty-five days to write and send comments on the Draft Environmental Impact Statement is too short. IDOT released the DEIS (with almost 400 megabytes of files) on Friday December 30, 2016. December 30 starts the 45 day Public Comment Period. Many people are busy over the New Year's weekend and will not read such a large DEIS from a study that started October 2009 and ended December 2016 (7+ years). With appendices, there are more than 2,200 pages. Within these pages are 192 figures and 78 tables. No one person has expertise in every aspect of a DEIS so people will want to talk with others before sending written comments to IDOT.
		Comments received past the advertised deadline of February 13, 2017 were considered and have been addressed in this response to DEIS comments.
88	Kuner – Citizens for Appropriate Transportation	b. A long response time by IDOT frustrates commenters and makes them wonder if IDOT is listening. A long response time casts serious doubt on IDOT's claim to value citizen participation. IDOT's Stakeholder Involvement Plan for Agency and Public Involvement (February 2010, Version 4) says, "Mail and e-mail responses offer the opportunity to develop a

#	Public Organization	Comment / Response (*in italics*)
		personalized response, yet timeliness is important. The desired time-frame to develop, edit, approve and mail (or e-mail) a response is one week once it is received by the PSG." (Page 17) NOTE: PSG = Project Study Group. IDOT responded to our June 27, 2010 letter on March 18, 2011 (415 days). IDOT responded to our June 19, 2012 letter on April 26, 2013 (311 days). IDOT's shortest responses were 29 days for our November 30, 2011 letter and 30 days for our June 28, 2011 letter.
		The I-290 planning process has been complex and characterized by extensive stakeholder feedback that has been considered throughout. In some instances, significant additional analysis was required (additional alternatives, expansion of the study area) prior to responding to stakeholder comments. A greater emphasis was placed upon a thorough response.
89	Kuner – Citizens for Appropriate Transportation	c. There was a long time between some of the Corridor Advisory Group / Task Force (CAG/TF) meetings. There were twenty-two CAG/TF meetings. The longest time gap between meetings was 426 days and the shortest was 29 days. The gap between meetings was longer than 180 days (about six months) four times. We are aware that IDOT met with individual communities. The Task Force includes people and agencies with specific interests, concerns, and expertise, which benefited IDOT in the preparation of the DEIS.
		Coordination with individual communities continued in between major events. For example, an intensive 18 month process within the Village of Oak Park that included 12 public meetings and over 21 staff level meetings was conducted at a time when only 3 CAG meetings were hosted.
90	Kuner – Citizens for Appropriate Transportation	d. Meaningful dialogue requires two-way communication so all participants learn from each other. IDOT has technical expertise. Citizens know their neighborhoods and have some technical expertise as well.
		IDOT made a concerted effort to incorporate the viewpoints of stakeholders who best know their communities into the design of the Preferred Alternative. There were 22 Corridor Advisory Group/Task Force meetings, 21 meetings of the Oak Park Working Group, 7 Maywood Advisory Working Group/Town Hall meetings, and numerous one-on-one meetings with municipalities, transit service providers, emergency service providers, and others who lent their expertise to create a project that enhanced community values. There are many examples of stakeholder involvement that directly affected the elements if the Preferred Alternative including improving expressway access in Maywood, improving bicycle, bus and pedestrian access to CTA Blue Line stations, and creating a new multi-use trail from Des Plaines Avenue to Austin Boulevard.
91	Kuner – Citizens for Appropriate Transportation	e. Consider Creative Funding Opportunities. Some ideas to consider are Value Capture whereby the CTA would capture some of the added value accrued to adjacent development by having a nearby CTA station. Another idea is to reduce the fare on the Forest Park Branch because its ridership is lower than the O'Hare Branch of the Blue Line.
		Funding and financing options will be studied in detail during Phase II (final design), and IDOT and CTA will continue to discuss funding and scheduling.
92	Kuner – Citizens for Appropriate Transportation	6. GENERAL COMMENTS a. Coordination between IDOT and CTA must occur. The IDOT – Village of Oak Park Letter of Intent says, "Funding for the reconstruction of the CTA Blue Line and I-290 should be sought for both improvements as if they were one project." Because of different priorities and funding programs, it is possible IDOT will improve the expressway years before a Blue Line extension occurs. Corridor residents and businesses may not see the full benefits for years. IDOT estimates eight years for construction, but has not decided whether to rebuild the bridges between Austin and Racine. If IDOT decides to rebuild these bridges, the construction estimate of eight years could get longer
		There are certain elements of the CTA Blue Line Vision Study recommendations that would need to be performed simultaneously with the I-290 reconstruction; namely, head station and access adjustments that are required to accommodate the reconstruction of cross

#	Public Organization	Comment / Response (*in italics*)
		road bridges. I-290 improvements are flexibly designed to incorporate the I-290 related Blue Line adjustments, or a complete Blue Line renovation simultaneously or in sequence. There is a concurrent IDOT Phase I study to address the bridges between Kostner Avenue and Racine Avenue. As part of the Preferred Alternative, IDOT intends to reconstruct all structures over I-290 from Cicero Avenue to the IHB Railroad bridge east of 25th Avenue.
93	Kuner – Citizens for Appropriate Transportation	b. IDOT's Study and the CTA's Study are at different stages, so coordination between the two will be difficult. Under Chicago Metropolitan Agency for Planning (CMAP) Go To 2040 plan, the improvements to the expressway are "fiscally constrained" (funds are likely to be available) and improvements to the CTA's Forest Park Branch of the Blue Line are "fiscally unconstrained," (projects may by desirable and beneficial but require additional revenue). IDOT has completed the DEIS and the CTA will complete their Feasibility / Vision Study shortly. The CTA has not started to prepare an Environmental Impact Statement, although doing so is unlikely to be as complicated and time-consuming as the DEIS for the expressway.
		I-290 improvements are flexibly designed to incorporate the I-290 related Blue Line adjustments, or a complete Blue Line renovation simultaneously or in sequence.
94	Kuner – Citizens for Appropriate Transportation	c. Proofreading Errors I did not make any effort to proofread the documents, but did notice the following errors. • In the Table of Contents (front_matter.pdf) on Page iii in the Table of Contents, 3.16 says Short-Tem Use instead of Short-Term Use. • In the Purpose and Need document (chapter_01.pdf), words are missing in the last sentence of the "No Build 2040" box on Page 1-4. The sentence stops in the middle. • In the Environmental Resources, Impacts and Mitigation document (chapter_03.pdf), the list of parks in Oak Park on Page 3-25, does not include the Conservatory. The Conservatory has outside gardens on the east and west sides. • Also in Chapter 3, Table 3-13 on Page 3-29 does not include District 97 in Oak Park. The table does list elementary and Middle School districts in other communities. The text on 3-29 says, "Three higher educational institutions are located at the eastern end of the Project Corridor in Oak Park and Chicago." The text mentions UIC, Rush University, and Malcolm X College all of which are in Chicago.
		Corrections have been made to the FEIS as needed.
95	Kuner – Citizens for Appropriate Transportation	We have come a long way. The CTA joined the study in the Summer of 2012. IDOT extended the eastern boundary of the Study Area to Racine. The design in Oak Park stays within the horizontal boundaries of the "ditch." IDOT added a ratio-scale evaluation to help select the Preferred Alternative. IDOT incorporated recommendations from the West Central Municipal Conference Smart Corridors Study. The Village of Oak Park and IDOT have a Letter of Intent that will become an Intergovernmental Agreement later in the study. IDOT completed the INVEST Sustainability Scorecard.
		Thank you for your comment.
96	Kuner – CAT Citizen's for Appropriate Transportation	I have a comment and then a question. The highway mode, represented by the I-290 expressway, is operating over capacity. And even with improvements that you are talking about with express lanes, it will still be overcapacity, although not as much as it is now. The rail transit mode, represented by the CTA Forest Park branch, is operating under capacity. And what's causing that is that the O'Hare branch of the Blue Line carries a lot more traffic than the Forest Park branch. So that dictates how frequently you run trains and what the headways are. So if you have a mode operating under capacity alongside a mode operating over capacity, it seems to me anything that both IDOT and CTA can do to get riders out of their cars and onto transit would be helpful. You are already serving the captive riders because they don't have a choice. And there are a variety of things you can do. And you are both qualified and you have got some good staff people and consultants so that seems to me to be doable. The question I would ask is, how amenable you are to extending the February 13 deadline? Having read or skimmed all of the EIS, which is in excess of 2200 pages with 192 figures and 78

#	Public Organization	Comment / Response (*in italics*)
		tables included, there is a lot to absorb. At this point, I think we can make the February 13 deadline. But that may not be possible. What does it do to your schedule if we ask for extra time for providing public comments?
		Comments received past the advertised deadline of February 13, 2017 were considered and have been addressed in this response to DEIS comments.
97	O'Neill – Grant Park Conservancy	With the retention, the noise wall, and I'm assuming there may be retention walls along the corridor, and landscaping, will there be opportunities for local artists to be involved in that and landscape engineers?
		There may be opportunities. In developing that plan, we will be working very specifically with the communities on what their desires and visions are. So that could be a possibility, but that's all yet to be discussed. To answer your earlier question on what would happen and how would all that fit so far as the Eisenhower, IDOT would add a lane in each direction without expanding the right-of-way footprint, and we would accomplish that by using 11 foot lanes on the inside through that stretch as well as using 10 feet of right-of-way from the CTA. As part of the Vision Study and the overall analysis, CTA identified that an express track would not be needed because the Blue Line today with the station spacing acts as an express operation.
98	O'Neill – Grant Park Conservancy	I think this project is a great opportunity to continue a collaboration with the renovation of the CTA Blue Line so that the two projects are well-integrated. Transportation is now more than just driving but it is also: biking, walking and taking public transit and as much as these can all be enhanced, the better. There is also an opportunity to make the Eisenhower Expressway project as green as possible.
		IDOT will continue to coordinate with CTA during final design ("Phase II") and construction. The I-290 project includes modal enhancements to non-motorized modes of transportation as well as improved access to transit, and there are also opportunities to include additional sustainability features per the recommendations in Appendix M (INVEST Evaluation).
99	O'Neill – Grant Park Conservancy	We worked with IDOT to have green offsets for all of the concrete and asphalt and pollution from driving that will be involved with the Jane Byrne Interchange project. That IDOT public process and green offsets have gone very well. As many trees as can be planted on IDOT property as well as nearby City of Chicago and other State property, will go a long way to not only making the Eisenhower Expressway project more calming and aesthetically-pleasing but help capture a lot of the carbon and pollutants put into the air. Thank you.
		There will be opportunities to promote green initiatives with the I-290 project. Additional green space adjacent to residential spaces is being created by the Preferred Alternative through use of retaining walls. Trees removed will be replaced according to IDOT's tree replacement policy, and through coordination with local stakeholders. IDOT is working with the communities regarding sustainability and aesthetic opportunities along the I-290 Corridor. The INVEST analysis of the project (Appendix M) indicates many opportunities to include additional sustainable features of the project, from re-using recycled materials to improvements in stormwater design and energy efficiency.
100	Norrington – North Lawndale Community Coordinating Council	I'm with the North Lawndale Community Coordinating Council. My question is employment. Will there be any job training opportunities? If not, what type of employment opportunities will be presented to our community?
		We engage in that through the work force development staff at IDOT, and there is a representative at this Public Hearing from IDOT's work force development program. IDOT can get you connected with that person to go over the particulars with that.

RESPONSE TO COMMENTS - INDIVIDUAL COMMENTS

#	Commenter Last Name	Comment / Response (*in italics*)
101	Alcazar	And I guess my comment is I would like the Eisenhower to be built more futuristically for what we know is expected instead of just a patch job for what we know of this today. Part of that means creating what we usually create when we are building unlimited space, and that is we go up instead of just out. And when we go out, we have to acquire property. And that's expensive and usually only the insiders get to buy that ahead of time. It would be wise to consider that if you build in the conventional way where you close a lane in order to create a new lane that you are going to create more congestion. And by the time that 2-year span of development is finished, you wind up with the same congestion you were at when you started because traffic increases. So instead, if you use the procedures we use in construction, which is to add layers, you could simply double the size of the traffic capability. And you could also create a safety feature by letting the trucks use the lower level and the cars, that will mostly be self-driving by the next five years, use the upper level. So you would increase safety and you would also double your capacity. You wouldn't have to close any lanes because you could build pillars or pylons alongside the highway. You can have avoidance of the weather problems we have in construction by having the slabs that go on top of those pylons be built inside. And they could be put into place with the current technology of flying cranes that are used now to put heavy objects on top of 50-story buildings. And you would be able to only close the highway during the lowest periods of the day, which is usually a couple hours at night as you put the slabs on. So it seems like using the known future as your guide instead of yesterday, 50 years ago or, no, I think it was 60 years ago when I was living alongside the Eisenhower as they were building it, only it was the Congress Expressway and we called it The Big Ditch. It screwed up our sledding when they put cars in there because we had to time it, but it was fun back then. Now it's not. Now it's a national embarrassment to go so slow at Austin and Mannheim. And even to have that slowness at 10 o'clock at night, it's just an embarrassment.
		In considering double-decking the Eisenhower, its current configuration must be taken into account. Because existing I-290 is below grade with cross-streets approximately 20' above the expressway, a double-deck facility throughout the length of the Study Area would create a third roadway level approximately 50-55 feet above the existing I-290. A decked roadway would be a bridge structure, which are dramatically more expensive than pavement. HOT lanes and managed lanes in general, are a relatively new innovation across the country. *In terms of self-driving cars, it is uncertain at this point of their future impact on transportation. IDOT will continue to monitor those developments, such as when that impact would occur, and how soon the entire vehicle fleet would turn over. Those are questions that are still being debated nationally. But certainly we will take a look at that.*
102	Alcazar	I would suggest we plan for the future. And we can do the same thing with the CTA if we put the Blue Line with a monorail above it, the monorail would be for the express to the suburbs and then the lower one would be for the Chicago traffic. And then you might have a lessening. But there is going to be so many people wanting to ride it that you would have increased ridership, so that would be a simple common current technology process also. As far as a real headache that drives me crazy, only because I have a modicum of common sense, is when I see the articulated bus by CTA (the double length ones that are the most expensive to maintain and fuel) going at 11 o'clock at night with 3 riders on the entire route, I wonder if there is someone at CTA thinking. Because there would be a more cost effective way to utilize that bus and a more cost effective way to handle those three passengers. Also, please tell the CTA that when they use their GPSs and they have got a full bus and an empty one behind, the whole dispatching system for CTA is designed to let the empty bus go ahead instead of staying behind. That would be a nice thing for the customers.
		CTA: The CTA needs to maintain the existing infrastructure before considering expansion. There are over 20 percent of the branches out there today that have slow zones on them. The CTA needs to bring that current infrastructure up to current design speeds before considering what might be done for an extension in the future.

#	Commenter Last Name	Comment / Response (*in italics*)
		As far as the CTA service planning comments with buses, we appreciate you giving those comments in a public forum because it will be heard by the planning staff, and we will have an opportunity to take those back.
103	Alcazar	I have a question on that. Why are nine of the Blue Line stops closed in the poorest section of the city where they most need jobs?
		CTA: There are eight CTA entrances that have been closed along the Blue Line over the years. Over 45 years ago, three stations were closed: California, Kostner, and Central. And two station entrances were closed in the 1980s, at Keeler and Lavergne, and the Cicero and Pulaski stations. The CTA's current recommendations are to reopen the auxiliary entrances at Pulaski and Cicero and Keeler and Lavergne. The auxiliary entrance at Keeler would help serve the market at Kostner. It is only one block from Keeler to Kostner, so it would serve that market. As far as the other locations go, the CTA has recently had some very successful infill stations. The Morgan station on the Green Line is one, and Cermak as well. After those successes, the CTA has instituted an initiative to consider looking at infill stations across our entire system because there are many opportunities. And those locations on the Blue Line are being considered, as well as locations system-wide on all CTA branches, to find the best opportunities for infill stations going forward. The CTA will continue to do infill stations. As money becomes available, CTA will have a program to continue to advance with those infill stations; "infill" meaning a station that is in between two existing stations, where there is no station now. The CTA has had some recent success with opening new stations on existing lines, and will continue to look at opportunities system-wide to do that going forward.
104	Alcazar	I would like them on the Eisenhower corridor to consider the future instead of just the patchwork for today. That means including a knowledge about current technology. What happens generally when you build something that's being replaced after 50 or 100 years, like we are doing now, is you look at the fact that traffic patterns have changed, quantity has changed. And you look at what the impact will be in building the change. Building this change would require them to close a lane in order to build a lane; that means traffic will get worse before it gets better. Time frame for when it gets better is possibly two years after the building starts. And by then, the traffic patterns will have increased to such a point where we would be right back at the current congestion level that we have today, which means that we will accomplish absolutely nothing but create inconvenience for the two years during the building. The only intelligent and logical thing to do is to build highways today anticipating that most cars will be able to be driverless and most cars will have a better safety feature by separating them from heavy trucks. So in order to avoid the fact that we have weather in Chicago and that that weather adds a disproportionate cost to building highways; that the way this highway should be built is to simple build pylons along the existing structure, like pillars, and concrete slabs to be built indoors so that they could be built to specification and serialized so we know which ones are going to be most efficient, and that we could draw back money from the companies that produce inefficient products that don't meet specifications based on their deposits, bonds. So once these slabs are built, which can be built in multiple manufacturing sites all over, they can be flown into position by flying cranes. And there would have been no traffic disruption, and we will doubled our capacity. So the ability then to separate the cars from the trucks, the ability to double the capacity instead of simply adding a lane with all the inconvenience and weather problems seems like a logical and easy solution.
		Because existing I-290 is below grade with cross-streets approximately 20' above the expressway, a double-deck facility throughout the length of the Study Area would create a third roadway level approximately 50-55 feet above the existing I-290. Due to the impacts of an elevated facility, as well as increased construction and maintenance costs, this concept was not carried forward for further consideration in Round 1 evaluation (Appendix C Alternatives Identification and Evaluation, Appendix A).
105	Alcazar	If we decided, in fact, to build for the future. Along with that build, if we were coordinating with CTA, we would add another level above the current Blue Line, which would be a uni-rail. That uni-rail would actually reduce the amount of traffic on the lower LTA line or the Blue Line because it would be an express train, so that it actually would have no stops until it hit the suburbs. So that would reduce the traffic for all the Chicago area, and it would speed traffic to the suburban areas; so we would wind up with a benefit in both directions. Uni-rails have become the world's most efficient way of travel. So to continue to build old-fashioned technology in both the CTA and highways seems like a ridiculous, backwards step that is only a patchwork.

#	Commenter Last Name	Comment / Response (*in italics*)
		I-290 is a vital transportation corridor that serves over 200,000 vehicles per and that connects people, communities and employment centers and addresses both a local and regional vison. I-290 experiences thousands of crashes, and the proposed improvement will improve safety, mobility for all users. This facility was originally constructed during the 1950s and is now at the end of its useful service life and is in need of reconstruction based upon its condition alone. *The managed lane concept represents state of the practice technology and includes Intelligent Transportation Systems (ITS) features. Also, in the future, the managed lane can integrate the emerging technologies if connected and automated vehicles. The CTA Blue Line Vision Study found that the Forest Park Branch of the Blue Line has long station spacing and serves as an express branch on the west side of Chicago, and that no additional 3rd track or express service is needed in the long term.*
106	Alcazar	Lastly, I would like to know if the materials used for this, what I consider a very poor plan, are expected to be either cement, concrete, or if they are, in fact, going to use asphalt. Obviously, if they use asphalt, it's being done as a make-work project since asphalt only lasts 7 years and requires annual maintenance for all the cracks and holes that it develops; where concrete lasts 30 years and would actually result in one quarter of the cost. So that's my suggestion and claim to fame.
		High-volume expressways in the Chicago area have been reconstructed with concrete in recent history. The use of Hot Mix Asphalt on high-volume expressways is usually limited to resurfacing and occasionally new shoulder construction or reconstruction.
107	Alcazar	One thing I would like to add. I would like to admit that I know one of the bars against my proposal is when you have to buy additional land and do an acquisition the insiders have already purchased it. So if they use my idea, those people wouldn't get the benefit of their bargain.
		One of the project goals is to minimize impacts to the surrounding environment, including building displacements. The Preferred Alternative includes only 5.44 acres of right-of-way needed along a 13-mile corridor and does not displace any residential or commercial buildings. This property would be acquired in accordance with state and federal regulations, laws, and polices.
108	Alcazar	I have extensive experience riding public transportation from having lived in downtown Chicago across from Grant Park, from having worked in West Chicago, near West Chicago, and from now living in the suburbs, and I would say that my first comment would be that after over 20 years having GPS, CTA should learn to use it. It's inexcusably incompetent to have a full bus with an empty bus behind it and not have enough sense to have the empty bus pass the full bus to alleviate some of the traffic. It's inexcusably incompetent to have up to three or four buses idling when it comes to where the buses stop and end. If those buses are all available idling, they should be redirected to a route that has people waiting. That's what GPS is designed to do with very simple dispatch systems that have been around for over 20 years. Not knowing how to use GPS tracking is incompetent and embarrassing and inconvenient.
		Thank you for your comment. Your comment has been forwarded to the CTA.
109	Alcazar	When it comes to the corridor of the Blue Line, it is unconscionably unpleasant and inexcusable to have nine closed stations along the Eisenhower and even along the Green Line only in the areas of the city that have the most poverty and the least access to private vehicle ownership. To have those people imprisoned because CTA has decided to close what was previously open access to the Blue Line, I think is criminal. These are people who we would like to have getting jobs who can't walk four or five blocks through gang-infested territories, going through two or three different gang territories in order to get to a stop during icy weather, snowy weather and extra hot weather and expect them to get jobs at UIC, O'Hare and other places that could be hiring them. I think CTA is complicit in creating a low-security prison for these impoverished territories. And if they would simply take their plans for the Eisenhower corridor and use current technology that already anticipates the future and put another line above the current line, make it a uni-rail line which is more cost effective and is considered the current cost-effective technology and make that uni-rail line an express line to the suburbs,

#	Commenter Last Name	Comment / Response (*in italics*)
		that will make better ridership for all the suburban people that would enjoy that kind of service and utilize it and it would also make improved ridership with the city transportation because it wouldn't be as crowded with all the suburbanites.
		Thank you for your comment. Your comment has been forwarded to the CTA.
110	Alcazar	The most expensive and costly buses that we have and operate and maintain are the ventriculated buses. Those buses are being utilized at midnight with three or four passengers on the entire route. That is unconscionable. A shuttle bus would be sufficient than use the most expensive bus. Has to have been an idea made by an idiot. Shoot yourself.
		The operating cost for operating a fixed-route bus vehicle is predominantly the labor cost of the bus driver. The length of the bus does not have a significant impact on the operating cost.
111	Al-Shawaf	I have a multi-point blueprint for the Eisenhower from the 88-294 junction through to Congress: (1) Create a bidirectional express lane with dynamic tolling that will levy an extra variable fee (depending on congestion) for inbound and outbound traffic. This will reduce congestion and generate revenue for the project. No one will need to pay the toll unless they opt for the express lane. Assume the expressway handles 200,000 cars per day and only 10% of those cars opt for the express lane. Assume also that the toll charge for the lane amounts to $5. The toll will generate $36.5 million annually in revenue.
		Sections 3.1.9.4 and 5.4 of the FEIS include consideration of variable toll rates where users would pay a higher toll for usage during peak travel times. The tolling strategy and operating characteristics will be developed in future phases of project development.
112	Al-Shawaf	(2) Depending on need, convert the Blue Line that runs along the Eisenhower into a below grade subway. This will provide space for extra lanes depending on long-term need.
		The costs of constructing a below grade subway would outweigh the benefits. Many alternatives were considered early in the study, including tunneling, which was not carried forward, as a Preferred Alternative was developed that accommodates the CTA's Blue Line improvements and address overall transportation needs without tunneling.
113	Al-Shawaf	(3) If the Blue Line is made a subway, consider extending the line further west and adding express or non-stop service with park and ride locations. Express service could terminate at the Block 37 station. Added service may also generate new revenues, which could be used to finance the project. Added express service will also reduce congestion.
		The I-290 Preferred Alternative includes provision for additional space in the median that is compatible with an at-grade Blue Line extension to Mannheim Road.
114	Anonymous 1	Also 2 full shoulders is massively important as well, even considering the confines of the right of way.
		This is a very constrained urban corridor with very limited space available for expressway widening and capacity improvements. The proposed shoulders and lane widths in the corridor address the needs to improve safety, operations and mobility with the available right of way; the proposed design requires minimal ROW and results in no displacements. Our analysis indicates that preferred alternative offers a 6.21% safety improvement. Overall, in the 9 mile reconstruction section, the preferred alternative will include 6 additional miles of shoulders that are 10 feet wide or more, compared to existing conditions.
115	Anonymous 1	In the film presentation, it is mentioned that there are planned improvements to North Avenue (thank you!) 22nd Street and Madison Avenue. How do the improvements to Madison Ave. coordinate with Oak Park's plan to reduce the lanes from 4 to 2? Does the right hand know what the left hand is doing?
		Off-system arterial improvements (which would extend generally between I-294 and Chicago) are being evaluated as part of separate Phase I studies, which would be implemented prior to mainline I-290 construction. The purpose of these off-system improvements will be to assist in the management of traffic flows and provide traveler information during the reconstruction of mainline I-290, and provide

#	Commenter Last Name	Comment / Response (*in italics*)
		community benefits beyond the construction of the Project. Within the Village of Oak Park, IL 64 (North Avenue) will be the primary route studied, and the general scope of work will involve improving pavement condition and operational improvements. Roosevelt Road (IL 38) and Madison Street are secondary off-system improvement routes for which more limited improvements could be considered. The Department will evaluate potential improvements requested by the Village to determine its suitability for addressing construction related traffic impacts, overall scope, and any cost responsibilities.
116	Anonymous 2	Have you planned for "kiss and ride" lots further west? Perhaps at Mannheim and Oak Brook?
		The proposed high capacity transit extension to Mannheim Road (CTA Blue Line extension) assumed park and ride and kiss and ride facilities at Mannheim Road. Similar facilities were also considered in the Round 1 Alternatives evaluation as part of high capacity transit extensions (Bus Rapid Transit and Blue Line Extensions) to Oak Brook.
117	Anonymous 2	Until you improve and extend the Blue Line and wean people from their cars, the road will fill up again.
		I-290 is a vital transportation corridor that serves over 200,000 vehicles per day and that connects people, communities and employment centers. I-290 experiences thousands of crashes. The proposed improvement will improve safety, mobility for all users. This facility was originally constructed during the 1950s and is now at the end of its useful service life and is in need of reconstruction based upon its condition alone. *There is currently a robust existing transit network in place today with 21% of the work trips using transit in the study area, as compared to 12% for the region. Transit in this corridor has been extensively studied and evaluated as part of the I-290 study and by others. Stand-alone transit improvements, such as the extension of the Blue Line, did not result in any travel performance improvement to the I-290 Expressway (see Section 2.3.3.1 of the FEIS). In addition, 54% of the new ridership on a Blue Line extension would come from existing transit services; this indicates a lack of supportive land use. However, a corridor is being preserved for a future extension which could be implemented when land use densities are more supportive. The concept of a HOT lane is that through variable congestion toll pricing, the use of this lane can be managed to maintain a minimum speed of 45 mph and would provide a reliable trip during all periods of the day.*
118	Anonymous 3	Instead of focusing on a freeway that has four lanes and is at 38% capacity. Attention should be focused on the Stevenson Expressway with its 3 lanes serving all the southwest suburbs and the preferred freeway for freight movement in the city which has bottlenecks at each on ramp. All that space in the median and the state wanted a bus lane now they want a toll lane. How about just adding a lane, and a carpool lane like all other major cities have figured out. Illinois is dropping the ball on this freeway, needs to be updated to accommodate today's freight and traffic needs.
		As documented in the DEIS, the I-290 corridor is congested, with limited space available for capacity improvements. Through an extensive evaluation of alternatives, the HOT 3+ alternative was selected as the Preferred Alternative, and would create a continuous 4 lane in each direction cross section along I-290 from Manheim Road to Racine Avenue. The HOT 3+ would accommodate a variety of users, including carpools, transit and general traffic. The traffic flow would be managed through variable toll rates that would rise and fall depending upon the level of congestion, and in doing so, provide a minimum 45 mph speed in the HOT lane. With respect to trucks, the I-290 corridor has a relatively low truck percentage at 5%, as compared to I-55 which experiences truck volumes up to 12%.
119	Anonymous 4	IL should just double decker I-290, eight lanes in both directions. Future proof.
		With the numerous overhead cross road bridges and rail freight and rapid transit also accommodated in the I-290 corridor, construction of additional elevated highway lanes on I-290 would be cost-prohibitive and would have substantial right of way impacts, especially at the touchdown points, which would require additional space for ramp connections. As a result, this was not considered for further study

#	Commenter Last Name	Comment / Response (*in italics*)
		after evaluation in Round One alternatives analysis (the initial round of analysis of alternatives, featuring a single mode such as highway or rail transit).
120	Anonymous 5	Adding additional lanes seems unnecessary and will serve only to increase traffic. While academic studies about induced demand haven't proved definitively that highways generate brand new traffic, there is absolutely plentiful data showing that the addition of new highway roadway diverts people from other time and other modes of transportation--and that not too long after the expansion is completed, the highway will be just as congested as it was before. In light of this, it would be irresponsible and short-sighted--and, frankly, a waste of taxpayer money--to expand the highway.
		I-290 is a vital transportation corridor that serves over 200,000 vehicles per and that connects people, communities and employment centers. I-290 experiences thousands of crashes, and the proposed improvement will improve safety, mobility for all users. Eighty percent of the construction cost is to reconstruct the existing facility, and only 20 percent is for additional capacity. I-290 is in a mature urban and induced demand is addressed through the No Build and Build forecasts which show a relatively minor increase in traffic volumes. Also, the Preferred Alternative will generate over 4,000 more daily transit trips than the No Build Alternative by 2040. *The introduction of a managed lane such as the HOT 3+ lanes of the Preferred Alternative will provide a reliable trip by managing use via variable priced tolling, while allowing vehicles with 3 or more occupants and transit vehicles to use the lanes for free. This encourages maximizing occupancy per vehicle and reducing the amount of vehicles on the road for a given person throughput. The HOT 3+ lanes would provide travel time savings of up to 56% and the remaining general purpose lanes would provide up to 25% time savings based on 2040 projections.*
121	Anonymous 6	This project seems to me another classic case of induced demand. Widening I-290, even if motivated by the concern over traffic, will do nothing to reduce it. According to history and research, it will only increase traffic.
		I-290 is a vital transportation corridor that serves over 200,000 vehicles per and that connects people, communities and employment centers. The HOT 3+ lanes would provide travel time savings of up to 56% and the remaining general purpose lanes would provide up to 25% time savings based on 2040 projections.
122	Anonymous 6	Adding lanes on I-290 is effectively a waste of taxpayer money. The argument that this "expansion" will provide net economic benefits and roadway capacity, thereby reducing congestion is ignoring traffic and induced travel impacts, changes in trip frequency and destination, incremental costs of induced travel and traffic (congestion, road and parking costs, accident, pollution emissions...), increased vehicle miles.
		I-290 is a vital transportation corridor that serves over 200,000 vehicles per and that connects people, communities and employment centers. I-290 experiences thousands of crashes, and the proposed improvement will improve safety, mobility for all users. 		occupants and transit vehicles to use the lane for free. This encourages maximizing occupancy per vehicle and reducing the amount of vehicles on the road for a given person throughput. The HOT 3+ lanes would provide travel time savings of up to 56% and the remaining general purpose lanes would provide up to 25% time savings based on 2040 projections.
123	Anonymous 6	This project seems it will be economically inefficient.
		I-290 is an important local and regional facility that connects people, communities, and employment centers, and needs to be reconstructed because much of the expressway is over 60 years old and is nearing the end of its useful service life. Approximately 80% of the cost of the I-290 reconstruction is to replace and modernize the existing pavement and bridges, and approximately 20% to construct the new HOT 3+ lanes and other improvements. The Preferred Alternative will also create $2.7B in productivity savings.
124	Anonymous 7	Widening I-290, even if motivated by the concern over traffic, will do nothing to reduce it. According to history and research, it will only increase traffic. Adding lanes on I-290 is effectively a waste of taxpayer money. "Trying to cure traffic congestion by adding more capacity is like trying to cure obesity by loosening your belt" (Duany, Plater-Zyberk, Speck, 2000).
		I-290 is a vital transportation corridor that serves over 200,000 vehicles per and that connects people, communities and employment centers. 127	Anonymous 10	Please add a lane to 290, and get rid of the awful left side ramps in Oak Park!

#	Commenter Last Name	Comment / Response (*in italics*)
		An additional HOT 3+ lane in each direction, and redesign of the Harlem Avenue and Austin Boulevard interchanges to a right-hand ramp design, are included in the Preferred Alternative.
128	Anonymous 10	If paying for the lane is such a problem, why not toll the road? I would gladly pay to avoid the terrible traffic i deal with now.
		Funding and financing options will be studied in detail during Phase II (final design).
129	Anonymous 11	Tolls are a bad idea. How about widening the Expressway. Tolls give the rich privileged access to this road.
		The I-290 Preferred Alternative recommends reconstruction of I-290 and providing an additional lane in each direction between Austin Boulevard and Mannheim Road. This additional fourth lane in each direction west of Austin Boulevard and the existing fourth lane east of Austin Boulevard would be a High Occupancy Toll Lane with carpools of 3+ persons and buses allowed in this lane for free. The I-290 Preferred Alternative includes three general purpose (no tolls) lanes in each direction (25% travel time improvement versus the No Build Alternative), and a HOT 3+ lane (variable toll depending on traffic congestion) in each direction with vehicles having 3+ occupants and transit buses traveling for free (56% travel time improvement versus the No Build Alternative), so users of I-290 would have a choice. National research has also shown that the choice to use a HOT lane is not based on income level (Washington State SR 167 HOT Lanes), support for HOT lanes across all income levels (San Diego I-15 FasTrak HOT Lanes), and in that all income groups value time saving and reliability for certain trips based on surveys in Minneapolis (see Section 3.9.4 in the FEIS).
130	Anonymous 12	This is utter and completely wrong. Why should the Eisenhower be turned into a toll road even if partially? The Dan Ryan underwent construction and no tolls were enforced.
		The levels of congestion on I-290 and the limited space for expansion supports the need to add capacity, but in a managed way to ensure that travel flows are reliable. The I-290 Preferred Alternative recommends reconstruction of I-290 and the construction of an additional lane in each direction between Austin Boulevard and Mannheim Road. This additional fourth lane in each direction west of Austin Boulevard and the existing fourth lane east of Austin Boulevard would be a High Occupancy Toll Lane with carpools of 3+ persons and buses allowed in this lane for free. The I-290 Preferred Alternative includes three general purpose (no tolls) lanes in each direction (25% travel time improvement versus the No Build Alternative), and a HOT 3+ lane (variable toll depending on traffic congestion) in each direction with vehicles having 3+ occupants and transit buses traveling for free (56% travel time improvement versus the No Build Alternative), so all users of I-290 would benefit. The I-290 Preferred Alternative would have four continuous lanes in each direction, rather than the current three lanes in each direction between Austin Boulevard and Mannheim Road.
131	Anonymous 12	The city should be responsible for funding the construction. We taxpayers are overburdened and can't afford any more increases, let alone to necessary roads and expressways. The city/state need to find a different solution.
		Funding will be further discussed in the next phase of project development of I-290.
132	Anonymous 13	Building more lanes is a poor choice, vs. providing incentives for fewer users to rely on the Ike. Blue Line has lots of excess capacity, but parking on the far end is a problem for users.
		I-290 is a vital transportation corridor that serves over 200,000 vehicles per and that connects people, communities and employment centers. I-290 experiences thousands of crashes, and the proposed improvement will improve safety, mobility for all users. This facility was originally constructed during the 1950s and is now at the end of its useful service life and is in need of reconstruction based upon its condition alone. Approximately 80% of the cost of the I-290 reconstruction is to replace and modernize the existing pavement and bridges, and approximately 20% to construct the new HOT 3+ lanes and other improvements. The Preferred Alternative's inclusion of a HOT 3+ lane encourages use of transit vehicles and 3+ carpoolers in the HOT lane, increasing person throughput while limiting the amount of vehicles in the lane by variable price tolling of vehicles with less than 3 occupants. The improvements to CTA station accesses for bicyclists and pedestrians at all stations from Forest Park to Cicero Avenue should make I-290 more transit-friendly. In

#	Commenter Last Name	Comment / Response (*in italics*)
		addition, the Forest Park interim and ultimate terminal improvements recommended by the CTA Blue Line Vision Study, including rearrangement of parking and station access, will be accommodated by the design of Des Plaines Avenue and the reconstructed I-290 interchange.
133	Anonymous 14	Do not allow tolls on the Eisenhower expressway 290. It's bad enough that I90 has tolls, now you want to punish motorists with a toll on 290. Bad decision. I may move.
		The I-290 Preferred Alternative includes three general purpose (no tolls) lanes in each direction (25% travel time improvement versus the No Build Alternative), and a HOT 3+ lane (variable toll depending on traffic congestion) in each direction with vehicles having 3+ occupants and transit buses traveling for free (56% travel time improvement versus the No Build Alternative), so users of I-290 would have a choice.
134	Anonymous 15	I agree that this corridor should be upgrade however, and let me be clear about this, I am absolutely and adamantly opposed to any kind of toll or tax increase of any size. You already have more than enough tax revenue so you may have to make very hard and very difficult decisions to pay for this. Live within your means! Do not attempt to raise taxes or add or increase tolls. NO!!
		The I-290 Eisenhower Expressway was constructed during the 1950s and is now at the end of its useful service life and in need of reconstruction. The Preferred Alternative includes reconstruction with three general purpose (no tolls) lanes in each direction (25% travel time improvement versus the No Build Alternative), and a new HOT 3+ lane (variable toll depending on traffic congestion) in each direction with vehicles having 3+ occupants and transit buses traveling for free (56% travel time improvement versus the No Build Alternative), so users of I-290 users would have a choice. In addition, the primary purpose of the tolling is to manage travel flow rather than generate revenue. Subsequent Phase II engineering and financial studies will determine potential tolling policies for the HOT lane. Currently, there is no funding committed for construction of this project.
135	Anonymous 16	My recommendation would be to extend the CTA Blue Line into DuPage County and offer more transportation options rather than trying to put a Band-Aid on the Ike.
		Extension of the Blue Line to Oak Brook was considered and evaluated in Round 1 of the single mode alternatives evaluation. This alternative did not result in any travel performance improvement to the I-290 Expressway in Round 1 analysis (See Section 2.3.3.1 of the FEIS). Our studies have shown that 54% of any new ridership generated by a Blue Line extension would be drawn from other existing transit services in the area. The expressway and the CTA Blue Line serve two different travel markets and as such a Blue Line extension would not result in any meaningful congestion relief. However, a corridor is being preserved for a future extension which could be implemented when land use densities are more supportive.
136	Anonymous 16	Once again, IDOT and the Tollway trying to squeeze more money out of DuPage County and the residents that commute every day into the City. It's bad enough that we already pay an unfair share of RTA tax to subsidize the CTA and other services. These lanes will only push more commuters onto I-55 and the already swamped Metra system.
		I-290 is a regional expressway facility and the western gateway to the city of Chicago. The I-290 Preferred Alternative includes three general purpose (no tolls) lanes in each direction (25% travel time improvement versus the No Build Alternative), and a HOT 3+ lane (variable toll depending on traffic congestion) in each direction with vehicles having 3+ occupants and transit buses traveling for free (56% travel time improvement versus the No Build Alternative), so users of I-290 would have a choice. IDOT has also proposed adding a new lane in each direction on I-55 in the form of an express toll lane (ETL). The purpose of these managed lanes is to improve capacity, reduce congestion, and improve safety for commuters and travelers on these regional facilities.
137	Anonymous 17	Please improve pedestrian access to CTA stations. The ramps at Austin and Harlem are dangerous, to cross even with a crossing signal.

#	Commenter Last Name	Comment / Response (*in italics*)
		The pedestrian crossings at Harlem Avenue and Austin Boulevard will be equipped with modern countdown-type pedestrian signals, pedestrian refuge islands across the ramp junctions, and high visibility crosswalk markings. In addition, wider pedestrian sidewalks and plaza areas will provide additional room for pedestrians and bus transit passengers who are accessing the Harlem Avenue and Austin Boulevard CTA stations. Section 3.1.8.2 of the FEIS provides more information on the proposed improvements at these locations.
138	Anonymous 18	I am strongly opposed to the proposal of installing sound walls along the 390-corridor through Oak Park. I have not seen evidence that the technology will have an impact that is commensurate with the investment. Additionally, I think they are often ugly and are likely to diminish the property value while also acting as a visual divider for our community.
		FHWA and IDOT recognize that many people find traffic noise to be objectionable, which is why traffic noise abatement is a required part of the analysis and is studied where noise impacts are found. Traffic noise abatement has been proven to reduce traffic noise, but does not eliminate noise. IDOT asks those who would have a perceptible benefit from abatement if they want abatement, because various characteristics of a wall may be supported or opposed by those behind the wall, and those who may be benefited should weigh those factors before voting for or against a proposed wall.
139	Anonymous 18	*Lombard Bridge: The bridge will be 1 foot lower. Currently, the Sight Lines in this area are obstructed by concrete walls combined with the sharp angle of the bridge merging into Garfield. Drivers make wide turns because of the lack of good Site Lines. The bridge acts as a walk way for Irving Elementary School children from their homes to school; the area is located by a park and community center with children drop off areas; and the Lombard CTA access point is located here. Since the bridge is IDOTs responsibility wrt building and design, the site lines and pedestrian traffic (specifically for small children) needs to be improved. Additionally, a Divvy bike station is located here. Many bicyclists cross at this bridge (since Ridgeland is a very busy street). Children ride their bikes over this bridge to their school friends located on the other side of the highway and to baseball and soccer games that occur at Barrie Park. A bike lane should be added to this bridge to assist with cyclist safety. Please note I know individuals who have been hit by cars multiple times at this intersection. It is not currently safe and the design needs to be greatly improved. Please consider adding speed tables or rumble strips prior to pedestrian walk ways to decrease driver speed.**
		In coordination with the Village of Oak Park, several pedestrian improvements are planned for Lombard Avenue. Section 3.1.8.2 of the FEIS provides more information on the proposed improvements to Lombard Avenue. Existing sidewalks that are between 5 and 6 feet wide will be improved to 12-feet wide along the west side and 16-feet wide along east side where the Blue Line CTA station entrance is located, and can be configured to accommodate a DIVVY bike rack near the CTA station entrance. Pedestrian plaza areas will be provided at each corner of the bridge to improve visibility and provide more space for pedestrian Activities. Connections to the east-west shared use trail, high visibility crosswalks and improved lighting are also proposed. Also, lowering of the Lombard Avenue profile will improve sight lines across the expressway by effectively lowering the existing 'hump' of the bridge over I-290 by 1 foot.
140	Anonymous 19	There is no need to give ease more to those who can afford it and put a burden on poor drivers who have to risk spending more on auto than food.
		The I-290 Preferred Alternative includes travel time improvements for both general purpose lane users (25% improvement versus the No Build Alternative), and to HOT 3+ lane users (56% improvement versus the No Build Alternative). Users of the HOT 3+ lane may pay the toll whose price will vary by the level of traffic congestion if they are driving alone or a vehicle with one passenger, or would travel for free if they are in a vehicle with 3 or more occupants or a transit bus. In addition, under the HOT 3+ lane alternative, buses will be able to travel in the managed lane The HOT 3+ lane also improves overall mainline operations, that will result in congestion relief on arterials by drawing longer distance trips off the arterial network and onto the expressway were they are better served. National studies cited in Section 3.1.9.4 of the I-290 FEIS found that choice to use HOT lanes was not based on income levels, and that there was support across all income groups for HOT lanes.

#	Commenter Last Name	Comment / Response (*in italics*)
141	Anonymous 20	I'm strongly opposed to HOT or HOV lanes. Either make it a tollway or don't. All the lanes should be interchangeable as to make sure there are never half of the lanes that are moving at different speeds. Splitting it by two lanes for general use and toll would be extremely undesirable for when I'm in that area. All lanes are needed to overtake slower vehicles as on the Tri-State where it is flawless in execution. I'm rather even have express/local lanes, but absolutely not HOV that is more about trying to altering driving behavior than expanding on capacity that is sorely needed. 4 lanes for everyone to use at their convenience once they're on 290 would be strongly preferred.
		During the alternatives development process, a four General Purpose lanes alternative was evaluated, but it did not perform as well as the HOT 3+ alternative. The inclusion of a HOT 3+ lane in addition to three General Purpose lanes is intended to provide a reliable trip (minimum 45 mph travel speed) in both directions for bus transit, carpoolers and toll-paying motorists with one or two occupants in their vehicles. In addition to being a source of revenue to help pay for the I-290 reconstruction, the primary purpose of the HOT 3+ lanes is to manage vehicle flow. The HOT 3+ lanes would provide travel time savings of up to 56% and the general purpose lanes would experience up to 25% time savings based on 2040 projections.
142	Avila	I can't believe we're even talking about adding lanes. We know it doesn't do anything to alleviate traffic. We need to invest in transit.
		I-290 is a vital transportation corridor that serves over 200,000 vehicles per day and that connects people, communities and employment centers. I-290 experiences thousands of crashes, and the proposed improvement will improve safety, mobility for all users. This facility was originally constructed during the 1950s and is now at the end of its useful service life and is in need of reconstruction based upon its condition alone. *It is also important to note that transit was also extensively evaluated as part of this study and many transit improvements are included as part of the Preferred Alternative. A study of an extension of the Blue Line did not result in any travel performance improvement to the I-290 Expressway (see Section 2.3.3.1 of the FEIS). In addition, 54% of the new ridership on a Blue Line extension would come from existing transit services; this indicates a lack of supportive land use. There is a robust existing transit network that accommodates 21 percent of work trips in this corridor versus 12 percent regionally.* *The Preferred Alternative includes travel time improvements to both general purpose lane users (25% improvement compared to the No Build Alternative), and to HOT 3+ lane users (56% improvement compared to the No Build Alternative). In addition, under the HOT 3+ lane alternative, express bus service will utilize the managed lane. Tolls would variable priced to maintain a minimum speed of 45mph in the managed lane.*
143	Bahnsen	Three questions have come up during this and what I'm asking now. What other project is this competing for funding that you have in district one of this scope?
		IDOT doesn't view this as competing with other projects in the region. There is currently not sufficient funding to pursue building this project. Planning is done in anticipation of funding; funding will be further discussed in later stages of project development.
144	Bahnsen	What will the times be when the HOV lanes are used? I mean just rush hours, or all the time? Or some places you can drive in them on Sunday even if there is only one person in the car.

#	Commenter Last Name	Comment / Response (*in italics*)
		For the High Occupancy Toll Lane, IDOT has come up with some toll rates at a conceptual level. More work needs to be done in the next phase of project development. At the low end was a conceptual cost of 12 cents a mile, and then at more congested times of the day it would be 24 cents a mile. Questions such as whether tolling will be discontinued at night are all things that haven't been decided, and more analysis needs to be done. The way it would work is: if you are a car pooler you would ride in the HOT lane for free; if you were a transit vehicle, you would ride for free; other users with less than 3 occupants per vehicle could ride in it, but would pay a toll. The HOT lane would have a mix of users in it.
145	Bahnsen	And then do you anticipate the state police enforcing this rule that there is two or three people in a car? If not, is there another way you envision this being done? I would think they would have other priorities in a city where 762 people were murdered last year than driving around and seeing how many people are in a car.
		In terms of enforcement, IDOT will look at the best practices across the country. Some states have drivers preregister as a car pooler. Other states have transponders that have a switch where the driver indicates if they are a car pooler or not, and the toll collection is reading that. There are also potential electronic detection technologies. But those are all things that are yet to be analyzed in the next phase of project development. And we will look at everyone else's best practices for that.
146	Banks	You answered part of my question concerning the bridge, bridgework that's going to be done. But being somewhat selfish from Oak Park, I'm still curious about the cost and what is actually going to happen. Because again, you have to widen the footprint a little bit and every bridge in Oak Park has got to be redone. The bridge ability to cross the expressway has to be redone. Then as I become less selfish and go all the way down to Racine, you have got a ton of bridges all the way that have to be done. Is all that cost still figured in the 2.7 million.
		The $2.7B includes reconstruction of I-290 and all bridges between Mannheim Road and Cicero Avenue. The bridges to the east of the Cicero Avenue are being addressed as part of a separate IDOT study. Those costs are not yet identified and are not included in the $2.7B estimated cost.
147	Banks	That seems short. But given the bridgework that needs to be done, you are going to be rebuilding completely practically every bridge along the way.
		The $2.7B includes reconstruction of I-290 and all bridges between Mannheim Road and Cicero Avenue. The bridges to the east of the Cicero Avenue are being addressed as part of a separate IDOT study. Those costs are not yet identified.
148	Barnes	I really have a sort of simple point, a little simpler than the letter I wrote, which is that I'm not much of a speaker anyways; so the ancient thing for doctors when they got endowed and moved into practice was First do no harm. I couldn't find the Greek name in my book so --And the three things that I have in mind are three things that I think have been taken fairly well care of. The first is the damage, damage to people. People are slowing, will slow down there and continue to slow down just out of practice if we don't do this. And if we do it, it's just the opposite; so we are doing harm if we do that. Because we really have lots of --I haven't, I have been half a mile from that entrance to the Ike for --Well, I haven't been on it for at least ten years. It's just too dangerous. I have been on it with a couple of other drivers, I just felt too dangerous. So to make it faster is my definition of a way of making it more dangerous, and that's the harm that we are doing with all that. We already have way too much damage to the people in our cars.
		I-290 is a vital transportation corridor that serves over 200,000 vehicles per and that connects people, communities and employment centers. I-290 experiences thousands of crashes, and the proposed improvement will improve safety, mobility for all users. This facility was originally constructed during the 1950s and is now at the end of its useful service life and is in need of reconstruction based upon its condition alone. I-290 is a vital transportation corridor that serves over 200,000 vehicles per and that connects people, communities and employment centers. The Preferred Alternative will also create $2.7B in productivity savings.

#	Commenter Last Name	Comment / Response (*in italics*)
149	Barnes	The second thing is the noise thing, of which quite a bit of effort has been made talking about that in Oak Park because there are so many people living and sleeping and everything so close to the road there. Same thing, more, more speed, more noise.
		The existing noise levels are already over the Noise Abatement Criteria (NAC) levels and the build alternatives do not increase the noise level in any meaningful way. Through technical analysis and stakeholder involvement, 46 walls are proposed out of 63 that were analyzed. A final decision with respect to the installation of noise abatement will be made during the Project's final design phase ("Phase II") and the public involvement process (see Section 5.5.4 of the FEIS).
150	Barnes	And the third thing is climate change. Again, we are really without any doubt doing damage. I have been saying this for 30 years, or I have been an activist for at least 20 years that I can remember. And just nobody says we need more driving or faster driving. Everybody says we need less. So this is we are doing damage when we don't have to do it.
		I-290 is a vital transportation corridor that serves over 200,000 vehicles per and that connects people, communities and employment centers. I-290 experiences thousands of crashes, and the proposed improvement will improve safety, mobility for all users. This facility was originally constructed during the 1950s and is now at the end of its useful service life and is in need of reconstruction based upon its condition alone. *The Preferred Alternative includes sustainability concepts such as carpooling, transit improvements, congestion pricing, and improved bike and pedestrian facilities including 2 miles of new east-west shared use path next to I-290 that effectively connects the Illinois Prairie Path to the City of Chicago.* *Regarding air quality and its potential impact on climate, the improvements of the Preferred Alternative are projected result in slight reductions of the various air pollutants as compared to the No Build Alternative (see Table 5-1 of the FEIS). Carbon Dioxide emissions, which are greenhouse gasses are projected to be 700 tons lower for the Preferred Alternative compared to the no-build condition.*
151	Barnes	Do I have to mention that Springfield doesn't have any money, or so they are always saying? Crazy.
		Thank you for your comment
152	Barnes	Speaking selfishly now for Oak Park. Oak Park loses if everybody just goes flying through. It's like they don't know we are there. They might be able to pull off and shop there or something like that, which isn't a personal interest to me. But I do think, it's a nice town. Some people like to drive through it, but they are going to have to not do that if this gets any faster down there. It's just too crazy. That's pretty much what I have to say.
		Thank you for your comments.
153	Barnes	I always visualize roughly the same 3 problems with your work. They are noise, safety and climate change. All three are serious objections: things which are under control will get worse if you add 2 more lanes.
		The existing noise levels are already over the Noise Abatement Criteria (NAC) levels and the build alternatives do not increase noise levels in any meaningful way. Through technical analysis and stakeholder involvement, 46 walls are proposed out of 63 that were analyzed. A final decision with respect to the installation of noise abatement will be made during the Project's final design phase ("Phase II") and the public involvement process. Before the initiation of noise wall related work in Phase II, the Department and the municipalities will assess whether public sentiment has changed, either due to a substantial time lapse since the noise wall vote in 2016, or changes in noise wall technology or policy that alter the composition of the walls. If it is jointly determined that there is a change in public sentiment, a new vote that obtains the viewpoints of the benefited receptors will be held (see Section 5.5.4 of the FEIS). Safety will be improved for all users, including pedestrian safety features such as pedestrian refuge islands, countdown cross-walk timers, high visibility crosswalks, improved lighting, improved signal timing, wider sidewalks and ADA accessibility. The

#	Commenter Last Name	Comment / Response (*in italics*)
		improvements of the Preferred Alternative are projected to result in a 6.21% reduction in crashes as compared to the No Build Alternative (see Table 5-1 of the FEIS). Regarding air quality and its potential impact on climate, the improvements of the Preferred Alternative are projected to result in minor improvements in air quality, as well as 700 tons less of CO_2 as compared to the No Build Alternative (see Table 5-1 of the FEIS).
154	Barnes	Then there's the astonishing amount of money. Illinois needs to spend that on public and higher education.
		I-290 is a vital transportation corridor that serves over 200,000 vehicles per day and that connects people, communities and employment centers. I-290 experiences thousands of crashes, and the proposed improvement will improve safety, mobility for all users. This facility was constructed during the 1950s and is now at the end of its useful service life and is in need of reconstruction based upon its condition alone.
155	Barnes	Lastly there's the question of urban sprawl (not sure if that's the best phrase). Promoting driving is bad in and of itself (very risky) and the speeding which is a direct result doesn't seem to be deterred by police anymore. I live less than a half-mile from the Austin entrance and prefer city streets: It's been at least 10 years since I drove on the Ike and went with other drivers twice and felt quite frightened that they felt forced to drive as fast as they did.
		Thank you for your comment.
156	Barnes	In addition, the need to get away from the Loop should make Oak Park attractive. What you're proposing if I grasp it accurately, will turn Oak Park - formerly a place to stop and shop - into a slum. Please emphasize the need to solve these (several) problems instead of accentuating them. I've been looking for common sense for about 10 years, still looking.
		IDOT has worked collaboratively with the Village of Oak Park to incorporate project elements that would enhance the appearance and functionality of the I-290 expressway and the CTA Blue Line. The traffic patterns of I-290 are well-established and are not anticipated to change substantially. There are operational and safety benefits projected with the Preferred Alternative. The additional HOT 3+ lanes will encourage more carpooling and bus transit use by providing a reliable trip with a minimum 45 mph travel speed. No tolls would be collected for transit vehicles and autos with 3 or more occupants, but would require users with one or two occupants to pay a toll.
157	Bassett-Dilley	My concern is the Lombard Bridge. Currently, the Sight Lines in this area are obstructed by concrete walls combined with the sharp angle of the bridge merging into Garfield. Drivers make wide turns because of the lack of good Site Lines. The bridge acts as a walk way for Irving Elementary School children from their homes to school; the area is located by a park and community center with children drop off areas; and the Lombard CTA access point is located here. Since the bridge is IDOTs responsibility w/r/t building and design, the sight lines and pedestrian traffic (specifically for small children) needs to be improved. Additionally, a Divvy bike station is located here. Many bicyclists cross at this bridge (since Ridgeland is a very busy street). Children ride their bikes over this bridge to their school friends located on the other side of the highway and to baseball and soccer games that occur at Barrie Park. A bike lane should be added to this bridge to assist with cyclist safety. Please note I know individuals who have been hit by cars multiple times at this intersection. It is not currently safe and the design needs to greatly improve. Please consider adding speed tables or rumble strips prior to pedestrian walk ways to decrease driver speed.
		In coordination with the Village of Oak Park, several pedestrian improvements are planned for Lombard Avenue. Section 3.1.8.2 of the FEIS provides more information on the proposed improvements to Lombard Avenue. Existing sidewalks that are between 5 and 6 feet wide will be improved to 12-feet wide along the west side and 16-feet wide along east side where the Blue Line CTA station entrance is located, and can be configured to accommodate a DIVVY bike rack near the CTA station entrance. Pedestrian plaza areas will be provided at each corner of the bridge to improve visibility and provide more space for pedestrian Activities. Connections to the east-west shared use trail, high visibility crosswalks and improved lighting are also proposed. Also, lowering of the Lombard Avenue profile will improve sight lines across the expressway by effectively lowering the existing 'hump' of the bridge over I-290 by 1 foot.

#	Commenter Last Name	Comment / Response (*in italics*)
158	Batie-Banks	I enjoy all of the improvements that I see. 99.9 percent of them are much wanted and needed. The problem is the issue of the wall. The wall will cut a community in half. I'll never see my neighbors on the other side of the expressway. I'll never see the functions on the other side of the expressway. I won't see the traffic flow that I'm used to seeing. I have been living in my house for 25 years. I have lived in the neighborhood all my life, and I believe the wall is just a negative influence. It's supposed to be 17 feet tall and that means that it's going to stand like a 2-story building blocking all views. Also, the wall will attract graffiti. It will give a hiding place, you know, duck around corners to hide behind a wall when unsavory activity occurs. It's not going to block any noise because noise is a part of living in Chicago. The wall will remind me daily of the wall that's around Cook County Jail and I don't want to feel like I'm in a jail. It's going to reduce property value, no matter when it goes up, it's going to start reducing the property value and even though it's ten years down the road, that's when we can expect the wall to start deteriorating the west side of Chicago. True, Chicago's west side is now on its way up. It's going to take a deep nose dive as soon as that wall goes up. And that's how I feel about it.
		FHWA and IDOT recognize that many people find traffic noise to be objectionable, which is why traffic noise abatement is studied where noise impacts are found. IDOT asks those who would have a noise reduction benefit from a wall to vote on the wall, because some characteristics of a wall (such as changes to views, aesthetics, community cohesion) may be more important to some people than traffic noise reduction.
159	Berger	In the recent mailing (received 1/27/2016) it is stated on the 3rd page of the brochure and Multi-Modal: Improved design for motorists, bicyclists, and pedestrians. Wider sidewalks and new east-west multi-use path. Could you please expand on this, especially describing in more detail how bicyclists will be affected and the location, length, access points, of the new east-west multi-use path.
		The new multi-use path will extend from Des Plaines Avenue to Austin Boulevard. The path will generally be 10 feet in width, and will be able to be accessed at, and at points between, Des Plaines Avenue, Circle Avenue, Harlem Avenue, Oak Park Avenue, East Avenue, Ridgeland Avenue, Lombard Avenue, and Austin Boulevard. The new path will also provide connectivity between the Illinois Prairie Path that currently ends at 1st Avenue and the southerly path through Columbus Park on the east. Pedestrian improvements are also planned at the Maybrook Drive intersection with 1st Avenue to connect the Illinois Prairie Path across 1st Avenue. Section 3.1.8.2 of the FEIS provides more information on the proposed trail.
160	Bloyd-Peshkin	I am writing in response to IDOT's draft environmental statement. I live half a block from I-290, and I commute to work every day on the Blue Line. My husband drives to work on the Eisenhower, so we are a multi-modal family and appreciate both transportation options. It is a mistake not to extend the Blue Line at least to 1st Avenue as part of the expansion of the Ike. More riders will mean fewer drivers, so when the expressway is expanded, cars will actually move faster (rather than increase in number to fill the extra space, as they did after the Hillside Strangler expansion). Expansion alone won't solve the congestion problem.
		The Preferred Alternative includes expansion of High Capacity Transit (HCT) from Forest Park to Mannheim Road. There is currently a lack of supporting land uses to support the extension of the Blue Line, and our studies have shown that 54% of any new ridership generated by a Blue Line extension would be drawn from other existing transit services in the area. The expressway and the CTA Blue Line serve two different travel markets and as such a Blue Line extension would not result in any meaningful congestion relief. *The I-290 DEIS and the CTA's Blue Line Vision Study, include provisions for Express Bus service in the HOT lanes of the Preferred Alternative upon completion of the I-290 improvements. The median of I-290 is also designed to be convertible to accommodate a HCT extension from Forest Park to Mannheim Road in the future, which could be a Blue Line rapid transit service extension.*
161	Bloyd-Peshkin	I also urge IDOT to consider helping to figure out how to make it possible for commuters to safely bicycle from the near western suburbs (where the Prairie Path ends) to the city. This would not only reduce congestion further, but also improve the quality of life for bike commuters.

#	Commenter Last Name	Comment / Response (*in italics*)
		The Preferred Alternative includes a new 2-mile separated bicycle/pedestrian multi-use path from Des Plaines Avenue to Austin Boulevard, as well as improvements and connections to the existing path in Columbus Park. While this multi-use path will not provide a complete route from the Illinois Prairie Path into downtown Chicago, it will help close the gap in the route and will allow continuous access between the Illinois Prairie Path and Columbus Park. The nearest bike lanes are located along Madison Street (buffer separated), about 2 ½ blocks north of Columbus Park.
162	Brandstrader	A quick budget question. Is the prep work, the advance work for the ancillary roads, included in the $2.7 billion number?
		For the advance work on the arterials, IDOT is just starting the planning for those corridors.
163	Brandstrader	And if not, what is that estimated dollar amount for the prep work, and is it funded?
		IDOT will develop a cost at the end of that planning; is the arterial advance work not included in the $2.7 billion.
164	Brandstrader	And then the last question was what is the budget for the CTA work.
		CTA: For the Vision Study, we have a cost estimate of $1.7 billion in current year dollars. We don't have a construction phasing plan, so we don't know which years those would be applied to, that includes modernization and accessibility improvements at all the stations of the branch. A new Forest Park terminal yard and shops and a maintenance facility and terminal at the end. The first element is the construction of the core infrastructure, which includes all the ballast and tracking.
165	Brandstrader	That's current dollars, the 2.7 is current as well?
		The $2.7 B cost estimate on the roadway side is future dollars, the midpoint of an assumed 8-year construction schedule.
166	Brandstrader	Per the Public Forum on 1/26 at the Marriott Hotel, IDOT and CTA confirmed: IDOT's construction cost estimate of $2.7B is in "future dollars" based on mid-term of an 8 year construction duration, though they didn't confirm at which year to start that "construction duration". So does that mean that the $2.7B amount is pro-rated for 2021 dollars????
		The mid-point of construction is where the "future dollars" were projected, and was estimated at year 2024. However, this is a hypothetical, best case scenario.
167	Brandstrader	IDOT stated that the $2.7B cost estimate does NOT include all of the ancillary roadway "prep" work (North Ave, Cermak, Madison, etc.).....IDOT does not know the scope of the prep work hence does not know how much to estimate that amount. There is no current funding for either the design or construction of this prep work. Will there be public meetings regarding the planning / design / implementation of this road work through the neighborhoods/communities?
		There will be public involvement regarding the arterial corridors, which are being studied separately.
168	Brandstrader	CTA confirmed that their $1.7B cost estimate is in current dollars, 2017.
		This is what was stated by CTA at the January 26, 2017 Public Hearing.
169	Brauer	I love this idea.
		Thank you for your comment.
170	Bridge	I am writing you today to avail myself of the opportunity to comment on the Draft Environmental Impact Statement (DEIS) on reconstruction of the I-290 corridor. It is an immense project and your lengthy DEIS reflects that size. Please extend the public comment period. Forty-five days is a relatively short period of time to comment on this 2200 page document.

#	Commenter Last Name	Comment / Response (*in italics*)
		Comments received past the advertised deadline of February 13, 2017 were considered and have been addressed in this response to DEIS comments.
171	Bridge	I would urge you to put reduction of congestion at the top of priorities for this project. Presumably, the rebuild of the expressway is necessary, given deterioration of bridges, ramps and the roadbed itself. This we can accept as a necessary fact of life. With the hindsight of decades of experience, the design of the expressway itself can be improved for the sake of safety and to better integrate it into its surrounding communities. But to rebuild it and to not substantially reduce congestion in the roadway would be a misuse of taxpayer dollars. The notion that congestion would be reduced from the current levels of 17 hours a day by less than an hour to 16.25 hours (in IDOT's best case scenario) is laughable in its insufficiency.
		The highway improvements associated with the Preferred Alternative would provide travel time savings of up to 56% in the HOT 3+ lanes and would provide up to 25% time savings in the general purpose lanes based on 2040 projections. To reduce congestion further on I-290 would require either expanding capacity (more lanes) or tolling all lanes. There is not enough space to add additional lanes beyond the HOT 3+ lanes (such as 5 lanes in each direction) without major impacts to existing homes and businesses; one of the project goals is to minimize impacts to the surrounding environment, including building displacements.
172	Bridge	Reduction of congestion is necessary to reduce air and noise pollution. It is also necessary to maintaining an economically efficient infrastructure for our region. To accomplish this we need better coordination between IDOT and the CTA. Extension and improvement of the west branch of the CTA Blue Line is absolutely essential to the success of the rebuild of the corridor. In fact, our Village of Oak Park has already urged that funding of improvements to the two modes of transportation should be made in tandem. I know that IDOT's focus has traditionally been on highway systems, but there are compelling reasons for tying an extension of the Blue Line and rebuild of the expressway together. Remember the huge amounts of money spent to "fix" the Hillside Strangler? Drivers along this stretch of I-290 have seen precious little relief from congestion there. Perhaps enhanced public transit would have helped.
		An extension of the Blue Line to Oak Brook was evaluated in the Round 1 Single Mode Alternatives analysis and was found to have insufficient diversion of traffic from I-290 to transit, and did not result in any travel performance improvement to the I-290 Expressway (see Section 2.3.3.1 of the FEIS). Additionally, this extension drew a considerable amount of riders from other existing transit services, which indicates a lack of supportive land use for a heavy rail transit extension. For these reasons, an extension to Oak Brook was not carried forward. However, of the new regional transit trips generated by extension to Oak Brook, 89% of the new transit trips were generated between Forest Park and Mannheim Road. Therefore, the Preferred Alternative is configured to accommodate a High Capacity Transit extension (such as the Blue Line) and initial service would include express bus that would operate in the managed lane. The CTA Blue Line Vision Study has prioritized modernizing the existing Forest Park Branch to a state of good repair, along with modernizing stations and the Forest Park terminal.
173	Bridge	Air quality is greatly influenced by congestion. You want to reduce emissions? Do something to reduce the amount of time we sit in traffic.
		Regarding air quality, the improvements associated with the Preferred Alternative are projected to result in slight improvements in air quality, and reduce CO^2 by 700 tons annually as compared to the No Build Alternative (see Table 5-1 of the FEIS). The HOT 3+ lanes proposed by the Preferred Alternative would use variable price tolling to regulate speeds in those lanes to a minimum of 45 mph travel speed... The remaining three General Purpose lanes in each direction are projected to have a 25% travel time savings.
174	Bridge	Ridership on the Blue Line continues to grow, despite the fact that service has been hampered by poor track repair and frequent slowdowns. Better service will encourage even more ridership.
		The CTA Blue Line Vision Study recommends improving the existing stations and their access points along the Forest Park Branch, bringing current facilities to a state of good repair, modernizing the Forest Park terminal, and removing unused stations. These

#	Commenter Last Name	Comment / Response (*in italics*)
		improvements would make the Blue Line more attractive to use and reduce the current number of "slow zones" which may attract riders.
175	Bridge	Admittedly, the impact of public transportation on traffic congestion is difficult to quantify. Simply comparing public transportation ridership figures with expressway usage is insufficient. Recent research (August 2013) by Michael Anderson of the University of California at Berkeley and the National Bureau of Economic Research, indicates that the impact of public transportation is far greater than ridership figures would indicate. Analysis of actual delays incurred during a transit workers strike in Los Angeles in 2003 revealed increases of 47% in delays in expressway commutes, despite only about one percent of commuters in the L.A. area using the transit system. The reason for the disproportionate impact was that, like the Blue Line, the LA transit system ran parallel to expressways and carried workers who would face the worst congestion. Other recent studies of transit in many U.S. cities indicates that transit construction has slowed the increase of congestion in many U.S. cities.
	Bridge	*In collaboration with regional transit agencies, transit was extensively evaluated and quantified as part of this study, and many transit improvements are included as part of the Preferred Alternative. The existing transit system plays an important role, and congestion would be higher without this system. However I-290 improvements are still needed.*
176	Bridge	Also of concern, again because of potential congestion, is the idea of expanding the number of lanes by including substandard eleven foot-wide lanes. I fear this could be self-defeating, as narrower lanes would create more of an accident hazard, that would in turn result in more accidents and thereby more slowdowns as a result of the infamous “gapers gap.”
		The I-290 corridor is urban and constrained with very limited space available for expressway widening and capacity improvements. The proposed shoulders and lane widths in the corridor addresses the need to improve safety and operations and mobility within the available right-of-way; the proposed design requires minimal right-of-way and results in no displacements. In some sections of the corridor, only the two inside lanes in each direction are proposed to be 11 feet wide, with the other 2 lanes in each direction at 12 feet wide, and all lanes 12 feet wide elsewhere Where the two inside lanes are 11 feet wide, they will be separated by a 2’ wide painted buffer, so the overall width of the two lanes is 24 feet Overall, in the 9 mile reconstruction section, the Preferred Alternative will include 6 more miles of shoulders that are 10 feet wide or more, compared to existing conditions. Our analysis indicates that the configuration of the Preferred Alternative offers a 6.21% safety improvement compared to the existing design.
177	Bridge	Finally, I would like to comment on transit related development. In recent years we have seen surges in development, primarily of housing, near mass transit stations, both in the suburbs and city. Although economic development is not the charge of IDOT, it wouldn’t hurt for IDOT to be sensitive to the positive ramifications of transit related development in the communities of Forest Park, Maywood and Bellwood. This is truly a case of “build it and they will come.”
		Thank you for your comments. IDOT will continue to work with communities regarding proposed development in the corridor as the project development process continues.
178	Burger	Hello, the following are my personal comments on the IDOT Eisenhower Expressway Draft Environmental Impact Statement (DEIS). Rebuilding the Eisenhower Expressway is a long overdue and much needed project to accommodate transport demands of Chicago and the Western Suburbs in the 21st Century. However, it is the generally incremental approach to this once in a lifetime opportunity that is a potential shortcoming. The prime problem with the DEIS is continued overwhelming reliance on single occupant transport as the long term solution to congestion and pollution problems. The implementation of High Occupancy Vehicle (HOV) lanes as well as bus dedicated lanes have been demonstrated to be marginal at best, even under heavily controlled conditions as articles like the following illustrate: http://www.accessmagazine.org/articles/spring-1995/are-hov-lanes-really-better/-- . The tendency has been that even with incremental improvements, such as what proposed, additional traffic taking advantage is will overwhelm capacity and bring about a return to congestion after a brief "honeymoon". The HOV line should be considered more of a transit lane, with buses and occupancy by 3 or 4 occupant vehicles, not just 2, as a standard.

#	Commenter Last Name	Comment / Response (*in italics*)
		Since that article was written in 1995, much has been learned about managed lanes. The Preferred Alternative is a HOT lane rather than an HOV lane. The HOT 3+ lanes (inside lane) will be used by transit vehicles and vehicles with 3 or more occupants, or vehicles with less than 3 occupants who pay a toll. Variable congestion-based pricing will be used to maintain a minimum average ravel speed of 45 mph; therefore providing a reliable trip for users of the HOT 3+ lane which will include busses and carpoolers.
179	Burger	Giving non-vehicle options remains a better way to keep cars off the road in areas that have sufficient density, which the Western Suburbs has. Therefore, a re-emphasis on expanding the CTA Blue Line to Mannheim Road, if not, Oak Brook, should be placed back on consideration and construction be planned for after the southern extension of the Red Line is underway or complete.
		An extension of the Blue Line to Oak Brook was evaluated in the Round 1 Single Mode Alternatives analysis and did was found to have insufficient diversion of traffic from I-290 to transit, and did not result in any travel performance improvement to the I-290 Expressway (see Section 2.3.3.1 of the FEIS). Additionally, this extension drew a considerable amount of riders from other existing transit services which indicates a lack of supportive land use for a heavy rail transit extension. For these reasons, an extension to Oak Brook was not carried forward. However, of the new regional transit trips generated on extension to Oak Brook, 89% of the new transit trips were generated between Forest Park and Mannheim Road. Therefore, the Preferred Alternative is configured to accommodate a future High Capacity Transit extension (such as the Blue Line) to Mannheim Road in the median of the expressway, and initial service would include express bus that would operate in the managed lane
180	Burger	My second comment is peripheral to transportation issues, but an opportunity to contribute to clean power. Sound barriers are being proposed for up to 12 miles of the Eisenhower from Ashland Avenue to Wolf Road. The northern side of the Eisenhower can have solar photovoltaic arrays added or substituted for portions that would be at minimal risk of vandalism or theft, and be built at minimal incremental cost. Every mile of a solar powered barrier can generate clean electricity for the equivalent of up to half a megawatt of capacity and be financed through the Future Energy Jobs Bill legislation recently signed into law. It is understood that IDOT has to be stewards of tax dollars for infrastructure, but as important, if not more so to not be so conservative or incremental that a project is obsolete or of insufficient capacity as soon or even before it is completed.
		Sustainability concepts will be further analyzed and discussed during Phase II/final design.
181	Busch	Will the stairs at the Lombard CTA entrance be replaced with a ramp? This would be a welcome improvement, as those stairs are very challenging if not impossible for many people to climb. When I was pregnant I had to sit halfway through. I've seen elderly people have much difficulty, not to mention it's impossible for anyone in wheel chair, yet that entrance is better to drop off anyone physically challenged vs the Austin entrance.
		Thank you for your comment. Your comment has been forwarded to the CTA.
182	Busch	What is the status of the wall?
		Traffic noise abatement that is likely to be implemented based on the results of the viewpoints solicitations (noise wall voting) for the project were presented at the public hearing and are shown in the FEIS Section 3.0 Map Set.
183	Busch	Hoping improvements being considered for Roosevelt and Madison will come to fruition. Cermak is not a viable alternative route for anyone in Oak Park during construction on 290. North Ave is also not realistic, most folks in Oak Park would take Lake Street.

#	Commenter Last Name	Comment / Response (*in italics*)
		Off-system arterial improvements are being evaluated as part of separate Phase I studies, which would be implemented prior to mainline I-290 construction. The purpose of these off-system improvements will be to help manage traffic flows during the reconstruction of mainline I-290, and provide community benefits beyond the construction of the Project. Within the Village of Oak Park, IL 64 (North Avenue) will be the primary route studied, and the general scope of work will involve improving pavement condition and operational improvements. Roosevelt Road (IL 38) and Madison Street are secondary off-system improvement routes for which more limited improvements could be considered. The Department will evaluate potential improvements requested by the Village to determine its suitability for addressing construction related traffic impacts, overall scope, and any cost responsibilities.
184	Busch	Garfield between Lombard and Ridgeland, particularly coming out of the Highland alley (west side) is notorious for poor vision lines. Many accidents arise due to cars parked on Garfield and also trees planted in spots that block vision lines. Will this be addressed?
		As part of this project, Garfield intersection improvements at Lombard Avenue and Ridgeland Avenue are proposed, however improvements along Garfield Street between these two intersections are outside the limits of the improvements as proposed, and not included as part of the overall Preferred Alternative.
185	Busch	I'm also very concerned about the Lombard Bridge being lowered. Currently, the Sight Lines in this area are obstructed by concrete walls combined with the sharp angle of the bridge merging into Garfield. Drivers make wide turns because of the lack of good Site Lines. The bridge acts as a walk way for Irving Elementary School children from their homes to school; the area is located by a park and community center with children drop off areas; and the Lombard CTA access point is located here. Since the bridge is IDOTs responsibility wrt building and design, the site lines and pedestrian traffic (specifically for small children) needs to be improved. Additionally, a Divvy bike station is located here. Many bicyclists cross at this bridge (since Ridgeland is a very busy street). Children ride their bikes over this bridge to their school friends located on the other side of the highway and to baseball and soccer games that occur at Barrie Park. A bike lane should be added to this bridge to assist with cyclist safety. Please note I know individuals who have been hit by cars multiple times at this intersection. It is not currently safe and the design needs to be greatly improved. Please consider adding speed tables or rumble strips prior to pedestrian walk ways to decrease driver speed.
		In coordination with the Village of Oak Park, several pedestrian improvements are planned for Lombard Avenue. Section 3.1.8.2 provides more information on the proposed improvements to Lombard Avenue. Existing sidewalks that are between 5 and 6 feet wide will be improved to 12-feet wide along the west side and 16-feet wide along east side where the Blue Line CTA station entrance is located and can be configured to accommodate a DIVVY bike rack near the CTA station entrance. Pedestrian plaza areas will be provided at each corner of the bridge to improve visibility and provide more space for pedestrian Activities. Connections to the east-west shared use trail, high visibility crosswalks and improved lighting are also proposed. Also, lowering of the Lombard Avenue profile will improve sight lines across the expressway by effectively lowering the existing 'hump' of the bridge over I-290 by 1 foot.
186	Capozzoli	*Lombard Bridge: The bridge will be 1 foot lower. Currently, the Sight Lines in this area are obstructed by concrete walls combined with the sharp angle of the bridge merging into Garfield. Drivers make wide turns because of the lack of good Site Lines. The bridge acts as a walk way for Irving Elementary School children from their homes to school; the area is located by a park and community center with children drop off areas; and the Lombard CTA access point is located here. Since the bridge is IDOTs responsibility wrt building and design, the site lines and pedestrian traffic (specifically for small children) needs to be improved. Additionally, a Divvy bike station is located here. Many bicyclists cross at this bridge (since Ridgeland is a very busy street). Children ride their bikes over this bridge to their school friends located on the other side of the highway and to baseball and soccer games that occur at Barrie Park. A bike lane should be added to this bridge to assist with cyclist safety. Please note I know individuals who have been hit by cars multiple times at this intersection. It is not currently safe and the design needs to be greatly improved. Please consider adding speed tables or rumble strips prior to pedestrian walk ways to decrease driver speed.**

		In coordination with the Village of Oak Park, several pedestrian improvements are planned for Lombard Avenue. Section 3.1.8.2 of the FEIS provides more information on the proposed improvements to Lombard Avenue. Existing sidewalks that are between 5 and 6 feet wide will be improved to 12-feet wide along the west side and 16-feet wide along east side where the Blue Line CTA station entrance is located, and can be configured to accommodate a DIVVY bike rack near the CTA station entrance. Pedestrian plaza areas will be provided at each corner of the bridge to improve visibility and provide more space for pedestrian Activities. Connections to the east-west shared use trail, high visibility crosswalks and improved lighting are also proposed. Also, lowering of the Lombard Avenue profile will improve sight lines across the expressway by effectively lowering the existing 'hump' of the bridge over I-290 by 1 foot.
187	Cappeller	Spending $2-3B and years widening the Ike will not solve the priority, which should be getting a lot of truck and other traffic off the Ike and headed toward rail/truck terminals around Cicero or IN and points east.
		I-290 is a vital transportation corridor that serves over 200,000 vehicles per and that connects people, communities and employment centers. I-290 experiences thousands of crashes, and the proposed improvement will improve safety, mobility for all users. This facility was originally constructed during the 1950s and is now at the end of its useful service life and is in need of reconstruction based upon its condition alone. *I-290 carries a relatively lower percentage of truck traffic (5 percent) as compared to other expressways in the region, such as I-55 that consists as much as 12% truck traffic.*
188	Cappeller	Consider this for "C11" OTHER Alternatives on the EIS. This is a concept to BYPASS the Congress IKE, removing some of its traffic and getting it headed to where it's going railyards and truck terminals around Cicero to I-55. It would be built over existing rail ROW mostly. Estimate 100 to 200 homes/business properties affected. This Hypotenuse project is the only thing that will solve many Chicago traffic problems. Complete Cook County's Second Tollway. Have a feeling after ALL is said and done with this I-290 project, NOTHNG WILL CHANGE.
		A new expressway within Chicago's urban area would have an unacceptable level of impacts and would not address the transportation needs in the I-290 corridor.
189	Carmichael	The IKE's inconsistent exit and entrance ramps cause delays from merging traffic. Some are on the left side others are on the right. Traffic slows when the ramps are on the left, which is supposed to be the lane for faster moving traffic. All ramps should be moved to right-hand side of the road.
		The Preferred Alternative includes relocating the left hand ramps at Harlem Avenue and Austin Boulevard to right hand ramps to be consistent with driver expectations with respect to exit and entrance ramp locations. Also, all interchanges and ramps from 25th Avenue to Cicero Avenue are proposed to be reconstructed to improve safety and operations.
190	Carmichael	IDOT should also consider tunneling so the CTA trains could be moved underground and then using that area for additional lanes. Those lanes could be tolled to cover the costs.
		Many alternatives were considered early in the study, including tunneling. Tunneling would be very costly, and would complicate an already problematic drainage issue in this corridor, so it was not carried forward. The Preferred Alternative was developed to accommodate the CTA's Blue Line improvements and overall transportation needs without tunneling.
191	Chan	For the alternatives for the geometry at Harlem and Austin I-290 exits, it's difficult for pedestrians to get to the CTA train stations w/continuous turning movements from the on/off ramps. In addition, drivers are making weaving movement right as they're getting off of I-290 (on Austin and Harlem) if they need to turn immediately onto the frontage roads (Harrison or Garfield).
		As part of the Preferred Alternative, full reconstruction of Harlem Avenue and Austin Boulevard is proposed, including substantial improvements for both pedestrians and vehicles. The proposed roadway and pedestrian improvements are documented in Section

#	Commenter Last Name	Comment / Response (*in italics*)
		3.1.8.2 of the FEIS and include large pedestrian plaza areas in all four corners of the intersection, wider sidewalks (up to 35-feet wide) in front of the CTA Blue Line station, pedestrian refuge islands between the ramp connections to provide improve pedestrian safety, bus-stops relocated in line with the Blue Line Station, high visibility cross-walks in all directions, signals with pedestrian countdown timers, connections to the proposed east-west shared use path, and improved lighting. Traffic operations will also be improved by overall geometric and turning path improvements, better demarcation between pedestrian and vehicular traffic, and accommodating dual left turn lanes from the I-290 ramps which will result in increased signal green time for local north-south traffic movements along Harlem Avenue and Austin Boulevard. Additionally, pedestrian walk phases will be provided during every cycle and be of sufficient duration to allow pedestrians to completely cross the intersection while traffic is stopped.
192	Chan	Can the noise walls be taller to accommodate balconies and apartments with multiple floors?
		The I-290 recommended noise walls benefited as many receptors as practicable. A receptor is an outdoor area of frequent human use, which includes balconies. It is more difficult, but not impossible, for a receptor above the first floor to receive a benefit from a wall, even if the wall increases in height. All receptors (including balconies) were studied for a noise wall in locations where I-290 noise impacts were identified, and noise wall heights were recommended that provided a noise reduction benefit to as many receptors as practicable. Noise walls are not increased in height simply to provide a line-of-sight visual barrier for receptors on higher floors – there must be a noise reduction benefit associated, and the taller barrier must also be cost-effective.
193	Chan	Not really in favor of any tolling.
		Thank you for your comment.
194	Clissold	Comment I had is when renderings of the noise walls are presented ongoing, they should also include a view looking directly across the Eisenhower both with and without the noise wall, and not just looking at an angle so that viewers can visualize what exactly coming up against one of those noise walls would look like aesthetically
		Thank you for your comment. Renderings were provided to the Village of Maywood and posted on the project website. The renderings were intended to portray the scale and context of the noise walls throughout the corridor. A final decision with respect to the installation of noise abatement will be made during the project's final design phase ("Phase II") and the public involvement process. Before the initiation of noise wall related work in Phase II, the Department and the Village will assess whether public sentiment has changed, either due to a substantial time lapse since the noise wall vote in 2016, or changes in noise wall technology or policy that alter the composition of the walls. If it is jointly determined that there is a change in public sentiment, a new vote that obtains the viewpoints of the benefited receptors will be held.
195	Davidoff	There needs to be an increase in the frequency of buses that run north-south to provide greater access to east-westbound trains, Green, Blue, and Metra lines. Reconfiguring Austin and Harlem exits from the left to the right would be a prolonged and costly construction project that it appears does not appear to be worth the benefits. According to a 2014 report from the Chicago Metropolitan Agency for Planning, the daily traffic on four ramps of Harlem and Austin account for approximately 94,000 vehicles in total per day. Over a two-year construction project, that would impact approximately 7 million planned trips.
		We have shared your comments with CTA and Pace and would also note that as documented in the Existing Public Transit Conditions Technical Memorandum (http://www.eisenhowerexpressway.com/pdfs/I290_ECTM_PublicTransit2010Apr14.pdf), service frequencies for north-south CTA bus routes in the study area range from 6 to 12 minutes during peak periods and 10 to 20 minutes for north-south Pace bus routes. Under the proposed design, delay on Harlem Avenue at I-290 would be reduced up to 46% in the peak hour, and up to 53% on Austin Boulevard at I-290. Regarding the left hand ramps, national studies have determine that left-hand ramps have a 60% to 180% higher crash rate than right-hand ramps. A detailed analysis of the I-290 crashes found that compared to similar right hand ramps along I-290, injury crash rates were 35% higher at Harlem Avenue and 58% higher at Austin Boulevard. In Phase II (final

#	Commenter Last Name	Comment / Response (*in italics*)
		design), IDOT will work with the local communities and stakeholders to develop and implement strategies to reduce minimize/mitigate construction effects.
196	Davidoff	I do, however, agree that a fourth lane to the right westward of Austin be constructed. Separately, parking along Augusta from LaSalle to Austin should be prohibited to make way for a four-lane road. While shared lanes would theoretically improve time on the Ike, individual commuter door-to-door time would have to significantly increase in order to pick up additional riders.
		Thank you for your comment. Regarding your comment about the parking along Augusta Street, IDOT does not have jurisdiction of that street and any changes would need to be initiated by the municipality.
197	Davidoff	There will be also a dangerous aspect for commuters looking for shared riders in forums like Craigslist that cannot guarantee safety.
		Commuters could be encouraged to from carpools through existing regional programs (Pace RideShare and VanPool Programs) or through employer-sponsored programs.
198	Davidoff	The majority of significant delays on the Ike are caused by accidents. Much of this is due to distracted driving and aggressive driving, which is not clearly addressed by the plan.
		According to police report data, less than 6 percent of crashes in high crash locations on I-290 had a reported distracted driver; this compares to 17 percent of crashes having a distracted driver nationally according to NHTSA (p. 10 of I-290 Crash Report Addendum 1, April 2011). Distracted driving is primarily an issue of state and national scope rather than being project-specific, and is addressed by public education (such as the current IDOT public service advertisements and overhead message board announcements warning of the dangers of distracted driving) and police enforcement of traffic laws. Regardless of crashes, I-290 is currently 34% over its ideal capacity in the six-lane section between 25th Avenue and Austin Boulevard.
199	Davidoff	No one should be comfortable with the plan as it is. It's outrageously expense, prolonged, and will not solve all the problems as we continue to move forward with westward expansion of Chicago.
		I-290 is a vital transportation corridor that serves over 200,000 vehicles per and that connects people, communities and employment centers. I-290 experiences thousands of crashes, and the proposed improvement will improve safety, mobility for all users. This facility was originally constructed during the 1950s and is now at the end of its useful service life and is in need of reconstruction based upon its condition alone. The proposed improvements will enhance safety for all uses, and includes wider sidewalks, pedestrian refuge islands, countdown cross-walk timers, high visibility crosswalks, improved lighting, improved signal timing, and ADA accessibility. The Preferred Alternative will also create $2.7B in productivity savings.
200	Davidoff	I am, sadly, a rush hour Ike driver. I know the pain of having to use the Ike to get downtown and back to Oak Park. Public transit is not feasible for me because bus schedules in Oak Park are too infrequent, and the hassle and cost of park-and-ride options outweigh the frustration of dealing with the Ike. Better public transit access in the western suburbs is needed to encourage drivers to leverage existing rail transit infrastructures. There needs to be an increase in frequency of buses that run north-south to provide better access to east-west trains such as the Blue Line, the Green Line, and the Metra. While increasing parking near rail lines benefits some, for most the hassle outweighs the benefits.
		The CTA and Pace operate fixed route bus service on major north-south arterial streets in the study area. As documented in the Existing Public Transit Conditions Technical Memorandum (http://www.eisenhowerexpressway.com/pdfs/I290_ECTM_PublicTransit2010Apr14.pdf), service frequencies for north-south CTA bus routes in the study area range from 6 to 12 minutes during peak periods and 10 to 20 minutes for north-south Pace bus routes. The CTA and Pace continuously try to balance passenger demand and bus service levels system wide, subject to their available operating budget. With regards to park-and-ride, the Blue Line Forest Park station is the only existing park-and-facility in the I-290 corridor. The Forest Park park-and-ride facility has available unused capacity.

#	Commenter Last Name	Comment / Response (*in italics*)
201	Davidoff	Reconfiguring the Austin-Harlem exits from the left to the right would be a prolonged and costly construction project that does not, in appearance, seem to be worth the benefits. According to a 2014 report from the Chicago Metropolitan Agency for Planning, the daily traffic on four ramps of both Harlem and Austin account for 94,000 vehicles in total per day. Over a, let's say, two-year construction project, that would inconvenience roughly 70 million planned trips. The magnitude of the impact to through traffic would be even more exponentially worse.
		The I-290 Expressway in this area is over 60 years old and is in need of reconstruction to address the age and condition of the facility, regardless of the proposal to reconfigure the interchanges from left-hand to right-hand ramps. The construction impacts of the project would be relatively short term in comparison to the design life of the corridor which is measured in decades; the actual work at the Harlem Avenue and Austin Boulevard ramps would be approximately 2 years. Crash analysis in this corridor has found that documented crash rates are higher at the left hand ramps as compared to right hand ramps (refer to the I-290 Combined Design Report, Section 3.4.2.4 – Existing Lane Drops and Left Hand Ramp Safety), and national studies have found that left hand ramps are 60% to 180% less safe than right side ramps. Left hand ramp exits and entrances are contrary to driver expectations, and the inside highway lane (left-most lane) is typically for longer distance, higher speed travel. The new ramp configuration will also reduce delay along Harlem Avenue and Austin Boulevard – the improved efficiency of the ramps will allow more "green" signal time for north-south traffic movements. Configuring all ramps in the corridor to right hand ramps will provide consistency along the corridor while improving safety and operations.
202	Davidoff	I do, however, agree that a fourth lane between Austin and Harlem and beyond be constructed to the right, as that project would be less costly and less disruptive than moving the ramps to the right while also minimizing bottlenecks.
		Thank you for your comment.
203	Davidoff	In that, the westbound entrance from Harlem should be extended similarly to the eastbound entrance on Austin to provide drivers with additional merging time. While shared lanes would theoretically improve time on the Ike, individual commuter door-to-door time would have to increase significantly in order to pick up additional riders. There would also be a dangerous aspect of commuters looking for shared rides in forums that cannot guarantee their safety such as identifying people on Craigslist.
		Between Harlem Avenue and Austin Boulevard, the Preferred Alternative adds a fourth lane in each direction and will relocate the left hand ramps to the right side which will move the merging traffic from the inside, higher speed lanes, to the outside lower speed lanes. There is not enough space available to add a fifth lane between these two interchanges without causing substantial impacts to the community. Commuters will select a mode of travel, which may be carpools, based upon a variety of factors including convenience, travel times, and costs. Existing programs for ride sharing are in place, such as the Pace RideShare and Vanpool programs.
204	Davidoff	The majority of significant delays on the Ike are usually caused by accidents. Drivers are distracted and are driving aggressively. We need our police force to have better laws and better enforcement of those laws in order to make the Ike a safer place to drive and reduce the speeds so that merging and changing lanes can be done safely.

#	Commenter Last Name	Comment / Response (*in italics*)
		According to police report data, less than 6 percent of crashes in high crash locations on I-290 had a reported distracted driver; this compares to 17 percent of crashes having a distracted driver nationally according to NHTSA (p. 10 of I-290 Crash Report Addendum 1, April 2011). Distracted driving is primarily an issue of state and national scope, and is addressed by public education (such as the current IDOT public service advertisements and overhead message board announcements warning of the dangers of distracted driving) and police enforcement of traffic laws. Posted speed limits will be addressed during final design of the project, and additional speed limit signage and messaging may be included in the Intelligent Transportation Systems (ITS) components of the project.
205	Davidoff	No one should be comfortable with the proposed plan. It's outrageously expensive, prolonged, and will not solve the long-term problem of ever-increasing traffic on the Ike as people continue to move to the western suburbs. It's my concern that there needs to be additional emphasis on rail transit access and that that should be the long-term solution.
		I-290 is a vital transportation corridor that serves over 200,000 vehicles per and that connects people, communities and employment centers. I-290 experiences thousands of crashes, and the proposed improvement will improve safety, mobility for all users. This facility was originally constructed during the 1950s and is now at the end of its useful service life and is in need of reconstruction based upon its condition alone. *In general, the purpose of the I-290 planning process is to address the transportation needs within the study area, rather than a targeted initiative that is solely focused upon transit improvements. The I-290 planning process included the participation of the region's transit agencies, and specifically, a partnership with CTA regarding the development of a Vision Study for the Forest Park branch of the Blue Line. It is also important to note that an extensive transit network exists within the study area, and 21% of the work trips use transit in the study area, as compared to 12% in the rest of the region. In addition, as part of the I-290 planning process, transit alternatives were studied in depth and coordinated with stakeholders, including the region's transit agencies. While the CTA has indicated that a Blue Line extension is a relatively low priority for their agency, the other important issue is that approximately 50% of the ridership for a Blue Line extension would consist of diversions from other existing transit services, which indicates that there is currently a lack of supportive land use to justify a heavy rail extension. However, the I-290 Preferred Alternative preserves a corridor for a future extension once the adjoining land uses are more supportive (i.e., density) of a fixed transit service. The initial service would be an express bus that would use the managed lane.* *The Preferred Alternative is a multi-modal alternative that includes improved access to transit, bike and pedestrian improvements (wider sidewalks, pedestrian plazas, improved crossings, ADA accessibility, shared use trail), and a design that can accommodate a future High Capacity Transit extension (CTA Blue Line) in the expressway median from Forest Park to Mannheim Road.*
206	DeCoursey	1) The Blue Line MUST be extended. The single biggest problem with the IDOT plan and their attitude is their refusal to seriously consider any attempt to extend the CTA Blue Line. I read one document they produced a year or two ago claiming to have explored this possibility. It concluded that extending the Blue Line would not produce one additional rider! This is so obviously absurd it I could not believe I was reading it! With the proposed new construction it is clearly a perfect time to extend the Blue Line. The effect on Eisenhower traffic would be phenomenal.

#	Commenter Last Name	Comment / Response (*in italics*)
		I-290 is a vital transportation corridor that serves over 200,000 vehicles per and that connects people, communities and employment centers. I-290 experiences thousands of crashes, and the proposed improvement will improve safety, mobility for all users. This facility was originally constructed during the 1950s and is now at the end of its useful service life and is in need of reconstruction based upon its condition alone. *Transit was also extensively evaluated as part of this study in collaboration with regional transit agencies, and many transit improvements are included as part of the Preferred Alternative.* *An analysis of potential CTA Blue Line extension to Oak Brook ridership was performed during the Round 1 evaluation. As shown in Figure 2-5. Trip Diversions within Transit Modes on page 2-14 of the I-290 DEIS, the CTA Blue Line extension to Oak Brook would attract 24,550 daily riders in 2040. However, 54% of these Blue Line extension riders would be attracted from other existing transit services. This indicates a lack of supportive land use for a heavy rail transit extension. However, a corridor is preserved for a future extension of the Blue Line to Mannheim Road in the median of I-290. Initially, express bus service will operate in the managed lanes. This Round 1 evaluation also found that the transit alternatives, such as a Blue Line extension, did not result in any travel performance improvement to I-290, primarily due to insufficient diversion from auto to transit due to its smaller, more compact travel market, as described in Section 2.3.3.1 of the FEIS.*
207	DeCoursey	2) Widening the section of the Eisenhower that is now three lanes, without widening the section east of this would INCREASE traffic from Oak Park into Chicago. This is absolutely certain. Every additional car from the wider section will increase inbound traffic. Already every morning the Ike is stopped during rush hour (frequently 30-50 minutes from Oak Park to the Loop, which should be 8 minutes). This winter, inbound traffic every morning is routinely at least 1 standard deviation above the mean travel time for the past 3 years. Selective widening of the 3 lanes to 4 would make this infinitely worse.
		The I-290 Eisenhower Expressway was constructed during the 1950s and is now at the end of its useful service life and in need of reconstruction. I-290 also has a lane imbalance, with four lanes in each direction west of Mannheim Road and east of Austin Boulevard. This lane imbalance also resulted in higher crash rates on I-290 at the lane drops. The Preferred Alternative corrects this lane imbalance by adding a new fourth lane between Mannheim Road and Austin Boulevard in the form of a high occupancy toll (HOT) lane. This results in three general purpose (no tolls) lanes in each direction (25% travel time improvement versus the No Build Alternative), and a HOT 3+ lane (variable toll depending on traffic congestion) in each direction with vehicles having 3+ occupants and transit buses traveling for free (56% travel time improvement versus the No Build Alternative), so there are four continues lanes in each direction. This elimination of the lane drop in each direction improves safety and traffic operations.
208	DeCoursey	3) Noise walls help for those right next to the expressway, but create ugliness and claustrophobia for everyone else. Covering the expressway with a park would be a great solution.
		IDOT is coordinating with the Village of Oak Park in identifying locations where extended decking could be considered at cross road locations. The potential of adding decking to the project, and potential cost participation, is subject to further coordination between IDOT and the village.
209	Diener	Dear Expressway Committee, after reading the latest news bulletin about the HOT 3+ lanes, I would like to submit an idea that I've had for several years about the Eisenhower Expressway. My idea would be to make the expressway a Variable Speed Expressway System (VSES). Average speed would be monitored and posted on electronic signs. During heavy use average speed would be less, making merging onto expressway easier with fewer backups and accidents. If during heavy use every motorist went 40-45 MPH I believe there would be fewer backups and fewer areas of major congestion. Best Regards, Dan Diener
		Variable speed limits will be considered as part of the Intelligent Transportation Systems (ITS) improvements. ITS features will be determined during the project's final design phase ("Phase II").

#	Commenter Last Name	Comment / Response (*in italics*)
210	Ester	I had two concerns. One, the walls. I know that's going to be discussed later but it just doesn't seem to be an understanding as to whose responsibility it's going to be to maintain them. There are walls in Hillside along the expressway that are not that old, they look ugly, there's cracks and greenery is growing through them. In the city the retention wall are cracking, they look horrible along the Eisenhower expressway. My concern is that eventually it's going to just be an extension of that ugly, poorly maintained. They are talking about now enhancing the landscaping and some additional walls. Who's going to maintain it? Because if you put greenery out there, we need to know. Some communities can't afford it so that's going to go ignored. Why even spend the money on that when the money could be used for something else.
		Maintenance of a noise wall is typically split between IDOT and the local jurisdiction on the non-highway side of the wall. IDOT is responsible for maintaining the overall structure - if the wall itself is damaged structurally, IDOT will be responsible to fix the wall. General maintenance such as graffiti and trash removal is completed by IDOT on the highway side of the wall, and the local jurisdiction on the non-highway side of the wall. Landscaping options will be discussed in more detail in the next phase of the project, Phase II Design. Vines are sometimes planted to soften the wall's appearance, as is the case with the walls in Hillside.
211	Ester	My other concern is the Pulaski, Keeler, Cicero, Lavergne ramps seems that they are too long. The safety of the riders is being jeopardized for those areas with that long space and there's not 24-hour security in place. The money seems it could be better utilized if you just have the smaller ramps and allow people to have access to those stations via some level of transportation, a different mode of transportation from one point to another. Say for instance from one end to another on bus routes, along bus routes. The entrances to the El stations if they were along areas where there are bus routes it would be better for the residents.
		Thank you for your comment. Your comment has been forwarded to the CTA.
212	Fishburne	Currently, the Sight Lines at Lombard Bridge at Garfield and Lombard are obstructed by concrete walls combined with the sharp angle of the bridge merging into Garfield. Drivers make wide turns because of the lack of good Site Lines. The bridge acts as a walk way for Irving Elementary School children from their homes to school; the area is located by a park and community center with children drop off areas; and the Lombard CTA access point is located here. Since the bridge is IDOTs responsibility w/r/t building and design, the site lines and pedestrian traffic (specifically for small children) needs to be improved. Additionally, a Divvy bike station is located here. Many bicyclists cross at this bridge (since Ridgeland is a very busy street). Children ride their bikes over this bridge to their school friends located on the other side of the highway and to baseball and soccer games that occur at Barrie Park. A bike lane should be added to this bridge to assist with cyclist safety. It is not currently safe and the design needs to be greatly improved. Please consider adding speed tables or rumble strips prior to pedestrian walk ways to decrease driver speed.
		In coordination with the Village of Oak Park, several pedestrian improvements are planned for Lombard Avenue. Section 3.1.8.2 of the FEIS provides more information on the proposed improvements to Lombard Avenue. Existing sidewalks that are between 5 and 6 feet wide will be improved to 12-feet wide along the west side and 16-feet wide along east side where the Blue Line CTA station entrance is which can be configured to accommodate a DIVVY bike rack near the CTA station entrance. Pedestrian plaza areas will be provided at each corner of the bridge to improve visibility and provide more space for pedestrian Activities. Connections to the east-west shared use trail, high visibility crosswalks and improved lighting are also proposed. Also, lowering of the Lombard Avenue profile will improve sight lines across the expressway by effectively lowering the existing 'hump' of the bridge over I-290 by 1 foot.
213	Fuhr	This project is desperately needed! Adding a HOT tolling lane is a creative idea and should be pursued, especially since transportation funding has become very challenged. With a public infrastructure falling apart, governments and agencies need more options to repair our infrastructure. The concepts shown are very creative and well thought out. Let's keep this project moving forward!
		Thank you for your comment.

#	Commenter Last Name	Comment / Response (*in italics*)
214	Gaynor	I live two houses south of the expressway in Oak Park. I soundly reject the proposal for sound walls. Not only are they unsightly, I expect that they will negatively impact my property value, their effectiveness minimal and will create even more of a divide between north and south Oak Park.
		FHWA and IDOT recognize that many people find traffic noise to be objectionable, which is why traffic noise abatement is a required part of the analysis and is studied where noise impacts are found. Traffic noise abatement has been proven to reduce traffic noise, but does not eliminate noise. IDOT asks those who would have a perceptible benefit from abatement if they want abatement, because various characteristics of a wall may be supported or opposed by those behind the wall, and those who may be benefited should weigh those factors before voting for or against a proposed wall.
215	Gaynor	I also suggest that the designers consider capping the Eisenhower. Doing so can create additional green space for the village and is visually more pleasant than looking at the expressway and possibly sound walls.
		IDOT is coordinating the Village of Oak Park in identifying locations where extended decking could be considered at cross road locations. The potential of adding decking to the project, as well as the required local cost participation, is subject to further coordination between IDOT and the village. This is mentioned further in Section 5 of the FEIS.
216	Geinosky	I think this project would benefit the region as a whole. However, if the exits on Harlem and Austin Ave are moved to right lane exits, then the overpasses should also be fixed. They are unsafe for pedestrians and drivers alike, and make it harder for people in the community to access the Blue Line.
		As part of this project, Garfield intersection improvements at Lombard Avenue and Ridgeland Avenue are proposed, however improvements along Garfield Street between these two intersections are outside the limits of the improvements as proposed, and not included as part of the overall Preferred Alternative.
217	Gentile	Now would be the time add more than one lane since capacity issues have not been addressed since the highway was first put into service. The addition of two more lanes in each direction will be a positive to the region for several generations.
		The Preferred Alternative offers a balance of providing improved operations and mobility in the corridor while avoiding impacts to the neighboring communities. The HOT 3+ lane with variable toll pricing would allow traffic on the HOT lane to be effectively managed to provide a reliable 45 mph trip through the corridor at any time of day.
218	Gill	The sound wall "vote" exercise suffered from poor public education prior to its taking. Example: the education effort ought to have been done in 2-3 cycles and prior to conducting the vote. Example: No one knew during or prior to the vote who was/wasn't entitled to vote. This prevented any neighbor to neighbor discussion/self-education.
		Seven separate public forums were held specifically regarding the traffic noise analysis. Maps were provided at those meetings (and online) showing which properties were eligible for a vote on proposed noise abatement. All properties eligible for a vote were sent project information, a plan view of the proposed wall, and renderings of the proposed wall. Two rounds of voting occurred for the majority of the project area (if at least one-third of voters did not respond to the first voting round), and three rounds of voting occurred in the west end of the project, which had design changes after the original noise wall vote was conducted.
219	Gill	Calibrating a model w/noise sampling, data may have missed the most annoying highway noise events: Noise during rush hours and free flow time periods are not the worst. Worst is at night when hiway is open and trucks and hotrods use the lonely open road to speed or use air brakes, etc. silence interrupted by noise events are more disturbing than any white noise during a typical day.
		Traffic noise monitoring is undertaken in order to determine whether the site-specific noise model for the project can accurately predict traffic noise compared to the real-world condition. Traffic noise levels and traffic data are recorded simultaneously. The traffic data is entered into the model, and the model's noise levels are compared against the monitored noise levels to check the accuracy of the site-

#	Commenter Last Name	Comment / Response (*in italics*)
		specific model. The monitored levels are not used as existing condition noise levels, nor are they used to determine noise impacts. The IDOT traffic noise handbook states that "Measurements should generally be conducted during the worst traffic-noise conditions. The time of day this occurs depends on the roadway being evaluated, but is typically represented by peak traffic conditions traveling at or near posted speed limits." Also, the FHWA impact criterion are generally based on 1-hour average (Leq) noise levels that would interfere with outdoor conversation. Therefore, the analysis is based on the loudest projected continuous hour, not individual noise events.
220	Gill	Selecting parcels in close proximity to the highway for exclusion from voting because of specious reasoning that the home is close to the junction of two sections of proposed wall, but including parcels/homes no less than 12 doors and 200 +/- feet from the quieter side/south side of the ditch in the "voting" is my best example of very poor reasoning, performed on the sound wall exercise.
		FHWA regulations and IDOT traffic noise policy state that a receptor receives a benefit from noise abatement, and an opportunity to vote on a proposed noise barrier, when the receptor receives at least a 5 decibel reduction in noise from the abatement. A five decibel reduction is a readily perceptible noise reduction. The majority of I-290 project area neighborhoods are densely developed urban areas with frequent bridges/structures over I-290. These crossings required noise barriers to end at structures over I-290, leaving receptors at the ends of barriers partially or unshielded from highway noise while receptors in the middle of the barrier were shielded from noise and benefited by a barrier. Receptors that are located near barrier ends are less likely to receive a benefit from abatement compared to a receptor located at the midpoint of the barrier.
221	Gill	You guys should do better, much better next time.
		Thank you for your comment.
222	Grandy	I became involved with this project about 8 or 10 years ago when it first started. As near as I can figure, it should have been ready to start already. I think we are still waiting. A couple things that perplexed me are when we initially got this going, we had talked about or it seemed to be coming at us that the Blue Line extension was going to happen sometime. And now I'm hearing that it's being pointed at the CTA instead of the RTA. And that perplexes me.
		IDOT: With respect to the Blue Line extension, it continues to be something with very high stakeholder interest. IDOT partnered with the CTA for this study, which found that over 50% of new ridership on a Blue Line extension would be coming from other existing transit services. Accordingly, the density of land use within the service area of a Blue Line extension does not currently support it as a standalone project. However, as part of the Preferred Alternative, IDOT proposes to provide a corridor and space for a future extension. Initially, an express bus service could operate in the HOT 3+ managed lane. *CTA: The CTA had a limited scope with the Vision Study, and followed the modeling results that IDOT did in looking at extension possibilities. With the Vision Study, the CTA focused on the existing infrastructure and shoring it up to achieve current design speeds, providing greater accessibility for the Forest Park branch.* *It is not practicable for the CTA to look at an extension before taking care of the existing infrastructure that is already there. So the first focus is on the existing facilities and service. And when that is taken care of, then the CTA would start to explore the possibility of an extension.*

#	Commenter Last Name	Comment / Response (*in italics*)
223	Grandy	My second point would just be an overall comment on the flyovers. I don't like them at all. I think they are going to be big. They are going to be ugly. They are going to be noisy. And I think that they are going to reduce what passes for the quality of life in a very congested urban environment.
		IDOT performed detailed noise and air analyses for the proposed Harlem Avenue and Austin Boulevard interchanges. There are some advantages in terms of noise with the proposed interchange design, where the combination of raised ramps and lowered I-290 mainline provide a walling-off effect that reduces expressway noise as compared to the current design. IDOT didn't find a perceptible change at the interchanges based on a more local analysis of air quality. IDOT has continued to work with Oak Park and the other communities on aesthetics to blend as much as possible with the surrounding communities. IDOT also took an extensive look at transit as part of the study; there are existing north-south bus services that are configured to connect the east-west CTA rail lines. The Preferred Alternative includes some slight refinements to better accommodate the connecting bus services. *The Eisenhower Expressway is beyond its useful design life. Therefore, a transit-only solution would not address those types of problems on the Eisenhower; it needs to be reconstructed regardless. IDOT also looked at improving the drainage system. Heavy rains in the last 5 plus years have resulted in complete closures of the Eisenhower. When the freeway closes, traffic is routed into the adjacent communities. Therefore, IDOT needs to make some major investments in the design of drainage to keep traffic where it needs to be and have it serve its function.* *IDOT found that the crash rates were higher at the Harlem Avenue and Austin Boulevard interchanges. National studies have shown that left-side ramps are anywhere from 60 to 180 percent less safe than right-side ramps, so that the right-side ramps will provide a safety benefit. A unique design is proposed so that, even though the two interchanges are with an interstate highway, it is a much more pedestrian-friendly design as compared to the existing condition in providing transit access and overall pedestrian accessibility across the streets. In the existing condition, the sidewalk just disappears. Defined pedestrian plazas connect with the improved sidewalks; in addition, connections are provided to a proposed east-west multi-use path.* *Construction on a major project is always a challenge. IDOT is going to be working closely with the communities during final design to come up with a plan for construction. As for ride sharing, carpooling is happening today on the Eisenhower. The administration of operation and enforcement of the HOT 3+ lanes is yet to be determined. However, the HOT 3+ lanes would encourage sustainable practices and get more efficiency out of the existing corridor. Crashes cause congestion, but the over-capacity traffic is causing congestion as well. The west end of the Eisenhower is 34 percent over capacity today. IDOT is proposing to improve the efficiency of the existing corridor without dramatically expanding its footprint. The HOT 3+ lanes are going to increase that efficiency; the tolling will be structured to provide a 45 mph trip, which cannot be relied on today on I-290. Travel improvements are also projected in the general purpose lanes. The purpose of planning is to develop a consensus plan, and it is started from the beginning with community input. IDOT will work on a financial plan as well, but will first complete the public process of defining the Preferred Alternative.*
224	Grigg	Please go forth with this project and make sure that those who travel in groups are able to use the HOV lane for free.
	Grigg	*The Preferred Alternative includes provisions for transit vehicles and carpoolers with 3 or more occupants per vehicle to use I-290 without paying a toll.*
225	Grigg	Also, please consider removing the entrances and exits within Oak Park. They are least of all an eyesore and most of all a highly inefficient and unsafe design.

#	Commenter Last Name	Comment / Response (*in italics*)
		The Preferred Alternative, removes the existing left hand ramps are removed and replaces them with a modified Single Point Urban Interchange design that places the entrance and exit ramps on the right, while bringing all traffic to a single intersection point atop the interchanges at Harlem Avenue and Austin Boulevard.
226	Grigg	As close to the city as Oak Park is, their residents should use side streets and frontage roads in their commute, and no one from the outer suburbs is traveling to there anyway.
		The Preferred Alternative improves travel times for users of both the HOT 3+ and General Purpose lanes, as well as interchange capacity and operations, and therefore benefits all communities within the Study Area.
227	Grotzke	The "environmental impact" of road building is always the same: additional pollution caused by automobile emissions, additional deaths and injuries caused by automobile traffic and the squandering of public funds on subsidies to automobile drivers.
		The I-290 Eisenhower Expressway was constructed during the 1950s and is now at the end of its useful service life and in need of reconstruction. The Preferred Alternative includes reconstruction of I-290 and the construction of an additional lane in each direction between Austin Boulevard and Mannheim Road in the form of a high occupancy toll (HOT) lane. The Preferred Alternative is expected to have an overall 6.21% improvement in safety (see FEIS Table 2-9, Round 3 Travel Performance Comparison), and will result in a small improvements in pollutant emissions, greenhouse gas emissions, and mobile source air toxics, as compared to the No Build Alternative, as described in Section 3.3 of the FEIS.
228	Grotzke	Federal and state funds dedicated to this project would be better spent on improving bus and rail service.
		Transit in this corridor has been extensively studied and evaluated as part of the I-290 study and by others. There is currently a robust existing transit network in place today with 21% of the work trips using transit in the study area, as compared to 12% for the region. Stand-alone transit improvements, such as the extension of the Blue Line, did not result in any travel performance improvement to the I-290 Expressway (see Section 2.3.3.1 of the FEIS). In addition, 54% of the new ridership on a Blue Line extension would come from existing transit services; this indicates a lack of supportive land use. The Preferred Alternative improves access to transit by all users and preserves a space for future High Capacity Transit extension west of Forest Park.
229	Gurgas	I have got a little bit of a laundry list. First, I was late because the CTA line stop on the flyer was incorrect. So it's a quarter mile away, so it took me a little while to get here so I don't have all the information because I just pulled on in. So some of this might be redundant. You list out the public paths for expansions. Have those been identified and who would fund those? I was going to say it is 80 percent IDOT payment?
		In terms of the paths and sidewalks, IDOT has a standard policy. Funding is 80 percent state and 20 percent local. We have actually identified the costs in the Village of Oak Park in the Letter of Intent. It is 100 percent IDOT cost for replacing anything that is disturbed by construction. Sidewalks on the bridges are 100 percent IDOT cost.
230	Gurgas	For the HOV lane, how do you plan on doing enforcement? Because they are fine. But if they are not properly enforced, they are not very effective. Also, with safety, given those HOV lanes, if you end up having the lane size reduced a little bit below standard roadways for Oak Park specifically, what are the current design heights for the off ramps?

#	Commenter Last Name	Comment / Response (*in italics*)
		In terms of enforcement for the HOT lane, we will review the best ideas across the country; there are HOT lanes in operation all over the country. The HOT lane infrastructure would be the last feature that is constructed. As the technology evolves, that will also be considered. For an urban corridor, an electronic system is likely. In terms of safety with the lane widths, IDOT did analyses of lane widths versus shoulder widths. We found that shoulder widths had a much bigger safety benefit than lane widths. With regard to the shoulder widths, there wouldn't be full shoulders everywhere. However, incidents could be managed using dynamic lane management (red X's or green arrows over a lane), similar to the Jane Addams Tollway.
231	Gurgas	I can't remember what the status of digging down the Ike was. The off ramps, was it the off ramps.
		The ramps at Harlem Avenue and Austin Boulevard are consistent with the 3D models that IDOT had prepared. The expressway is being lowered in several locations, particularly at Harlem Avenue. Further lowering would cause drainage concerns and railroad grade concerns. The cross road bridges would be either at the same height or lower. We were able to work with the CSX railroad to identify and improve their clearance without raising those cross road bridges.
232	Gurgas	When are you planning on resurveying the noise wall, survey? The noise wall, revisiting the noise wall was one of the other ones.
		The design plans (Phase II) would not be pursued all at the same time. It will likely be in layers and stages; and the noise walls may be one of those end construction items. Therefore, the walls may be designed later in the design phase. When the design phase comes up for the noise walls, IDOT will go back to the communities and ask if the public sentiment has changed. And if so, then IDOT will reopen the issue for discussion. If public sentiment hasn't changed, we just focus on aesthetics - what the wall would look like.
233	Gurgas	Some of the bridges between the off ramps, what is the current design pitch on those? Because when I was trying to read the EIS, I was having a hard time finding that.
		The preliminary geometry can be located in the Combined Design Report, Appendix H. The proposed grades of the cross road bridges in Oak Park Range between 2% and 3.6%. The maximum height of the bridges will be at the same height of the existing bridges, or lower. The crest of the Lombard Avenue bridge will be 1 foot lower than the existing bridge.
234	Gurgas	I attended the January 26, 2017 IDOT Public Meeting. Below is some specific information which was conveyed to me by IDOT staff which I would like to confirmed during this public comment period. Austin Bridge: Current Garfield/Harrison streets are at around 615-620 ft. Austin bridge overpass will be 625 ft. The fly over off ramps will be 2-4 feet higher than Garfield Road at the highest point. There will be an approximate 4 foot high concrete wall along Garfield to help block the view of the fly over ramp (not the sound wall). The highway by Austin will be dug down 5 feet. If this information is accurate, I have no comments regarding the Austin bridge and associated fly over off ramps.
		The proposed height of the Austin Boulevard bridge, and the elevation of the ramp connections will not increase compared to existing conditions (Elevation 623.5 feet). The current Garfield/Harrison Streets are between elevations 615-620. The Austin Boulevard bridge will be approximate elevation 625 at its highest point. The off-ramps will be approximately 2-4 feet higher than Garfield Street at the highest point. A short wall is proposed to be added to the top of the existing retaining wall along Garfield as a safety element. Currently, there is a metal railing along the top of the wall. The I-290 highway below Austin Boulevard will be lowered by approximately 5 feet below existing.
235	Gurgas	Harlem Bridge: By Wenonah, the fly over off ramp will be 6 feet below surface street. By Maple, the fly over off ramp will be 3 feet higher than surface street. There will be an approximately 4-5 foot high concrete wall in that area to block view (not the sound wall). The highway by Harlem will be dug down 7 feet. If this information is accurate, I have no comments regarding the Harlem bridge and associated fly over off ramps.

#	Commenter Last Name	Comment / Response (*in italics*)
		The proposed height of the Harlem Avenue bridge, and the elevation of the ramp connections, will not increase compared to existing conditions. By Wenonah Street, the off-ramp elevation will be approximately 6 feet below the surface street. Wenonah Street is at approximate Elevation 619. By Maple Avenue, the off-ramp will be 10 feet higher than the surface street rather than 3 feet as stated by your comment. Maple Ave is at approximate Elevation 620. The ramp is at approximate Elevation 630. A short wall is proposed to be added to the top of the existing retaining wall along Garfield Street and Harrison Street as a safety element. Currently, there is a metal railing along the top of the wall. The I-290 highway below Harlem Avenue will lowered up to 8 feet below existing.
236	Gurgas	Lombard Bridge: The bridge will be 1 foot lower. Currently, the Sight Lines in this area are obstructed by concrete walls combined with the sharp angle of the bridge merging into Garfield. Drivers make wide turns because of the lack of good Site Lines. The bridge acts as a walk way for Irving Elementary School children from their homes to school; the area is located by a park and community center with children drop off areas; and the Lombard CTA access point is located here. Since the bridge is IDOTs responsibility w/r/t building and design, the site lines and pedestrian traffic (specifically for small children) needs to be improved. Additionally, a Divvy bike station is located here. Many bicycles cross at this bridge (since Ridgeland is a very busy street). Children ride their bikes over this bridge to their school friends located on the other side of the highway and to baseball and soccer games that occur at Barrie Park. A bike lane should be added to this bridge to assist with cyclist safety. Please note I know individuals who have been hit by cars multiple times at this intersection. It is not currently safe and the design needs to be greatly improved. Please consider adding speed tables or rumble strips prior to pedestrian walk ways to decrease driver speed.
		In coordination with the Village of Oak Park, several pedestrian improvements are planned for Lombard Avenue. Section 3.1.8.2 of the FEIS provides more information on the proposed improvements to Lombard Avenue. Existing sidewalks that are between 5 and 6 feet wide will be improved to 12-feet wide along the west side and 16-feet wide along east side where the Blue Line CTA station entrance is which can be configured to accommodate a DIVVY bike rack near the CTA station entrance. Pedestrian plaza areas will be provided at each corner of the bridge to improve visibility and provide more space for pedestrian Activities. Connection to the east-west shared use trail, high visibility crosswalks and improved lighting are also proposed. Also, lowering of the Lombard Avenue profile will improve sight lines across the expressway by effectively lowering the existing 'hump' of the bridge over I-290 by 1 foot.
237	Gurgas	Lanes: HOT Lanes - will only be divided by paint lines and there are no current plans for enforcement. A more concrete plan should be developed for enforcement of these lanes. Lanes will be decreased from 12 feet wide to 11 feet wide, all areas will have a minimum of 4 foot shoulder (even under bridges). Please confirm. These reductions in lane and shoulder widths are a safety concern to me.
		Operational and enforcement aspects of the I-290 managed lane will be developed and discussed with stakeholders during Phase II (final design). In some sections of the corridor, only the two inside lanes in each direction are proposed to be 11-feet wide, with the other 2 lanes in each direction at 12-feet wide, and all lanes 12-feet wide elsewhere Where the two inside lanes are 11-feet wide, they will be separated by a 2' painted buffer, so the overall width of the two lanes is 24-feet Overall, in the 9 mile reconstruction section, the Preferred Alternative will include 6 more miles of shoulders that are 10-feet wide or more, compared to existing conditions. Our analysis indicates that the configuration of the Preferred Alternative offers a 6.21% safety improvement compared to the existing design.
238	Gurgas	Ancillary Items: Noise wall - will be revisited and citizens re-surveyed again during construction. Oak Park was divided by the highway and we do not need sound walls to add to the separation in our community.
		A final decision with respect to the installation of noise abatement will be made during the project's final design phase ("Phase II") and the public involvement process. Before the initiation of noise wall related work in Phase II, the Department and the Village will assess whether public sentiment has changed, either due to a substantial time lapse since the noise wall vote in 2016, or changes in noise wall technology or policy that alter the composition of the walls. If it is jointly determined that there is a change in public sentiment, a new vote that obtains the viewpoints of the benefited receptors will be held.

#	Commenter Last Name	Comment / Response (*in italics*)
239	Gurgas	Public Paths - 80% funded by IDOT, 20% by local municipalities. IDOT will be paying for 80% of the walk ways and bike paths as shown in the design drawings including plantings and art work. IDOT will be upgrading a number of artillery roads (North, Cermak, I55, Madison, and Roosevelt). Please consult with the City of Oak Park as they are planning to decrease lanes along Madison. Traffic will be very bad in our community during construction. Added safety measures need to be implemented to keep pedestrians and cyclists safe.
		IDOT will pay 80% of the cost of new sidewalk or multi-use paths with the local agency paying the other 20% plus maintenance costs. Plantings and art work are subject to 100% local participation over and above "base" improvements. Final details of cost participation will be determined in formal agreements between local agencies and IDOT during the project's final design phase ("Phase II"). IDOT is aware of Oak Park's planning of Madison Street improvements, which will convert the street from a 4-lane to a 3-lane design with a center two-way left turn lane and two through lanes. As part of the arterial improvements, design features will be developed in coordination with local municipalities.
240	Gurgas	Pedestrian Safety The pedestrian crossings still appear to be unsafe at Harlem and Austin. Speed tables or rumble strips should be inserted prior to pedestrian walk ways to decrease driver speed.
		The pedestrian crossings at Harlem Avenue and Austin Boulevard will be equipped with modern countdown-type pedestrian signals, pedestrian refuge islands across the ramp junctions, and high visibility crosswalk markings. Speed bumps and tables are not recommended where traffic is over 5,000 vehicles per day, or on major emergency response routes; thus Harlem Avenue and Austin Boulevard are not recommended for these types of traffic calming methods. Section 3.1.8.2 of the FEIS provides more information on the proposed improvements at these locations.
241	Gurgas	CTA: CTA selling 10 feet of their right of way to IDOT for highway expansion; there will be no future ability to add express trains to the Blue Line. No reduction in access to any CTA locations. Additionally note, the IDOT flyer gave the wrong directions to this Public Comment / Informational event with the directions leaving CTA riders about 1/4 mile from the hotel. I took public transit and was late to the event due to this inaccurate information. I think this mix up makes IDOT look bad and reinforces the public perceptions that IDOT is only about building and expanding roads and is not an advocate for holistic transportation solutions.
		The CTA Blue Line Vision Study found that the Forest Park Branch of the Blue Line has long station spacing and already serves as an express branch on the west side of Chicago, and that no additional 3rd track or express service is needed in the long term. We apologize for the incorrect information on the public hearing invitation regarding the nearest transit station.
242	Haley	Please do a thorough evaluation of the site lines and design of the bridge at Lombard Ave. in Oak Park. There is a great deal of foot traffic on the south side of the bridge, and the height of the sidewalk and the narrowness of Garfield Ave. make turns difficult and dangerous.
		In coordination with the Village of Oak Park, several pedestrian improvements are planned for Lombard Avenue. Section 3.1.8.2 of the FEIS provides more information on the proposed improvements to Lombard Avenue. Existing sidewalks that are between 5 and 6 feet wide will be improved to 12-feet wide along the west side and 16-feet wide along east side where the Blue Line CTA station entrance is located, and can be configured to accommodate a DIVVY bike rack near the CTA station entrance. Pedestrian plaza areas will be provided at each corner of the bridge to improve visibility and provide more space for pedestrian Activities. Connections to the east-west shared use trail, high visibility crosswalks and improved lighting are also proposed. Also, lowering of the Lombard Avenue profile will improve sight lines across the expressway by effectively lowering the existing 'hump' of the bridge over I-290 by 1 foot.
243	Henning	No more lanes
		Thank you for your comment.

#	Commenter Last Name	Comment / Response (*in italics*)
244	Hills	Please make the decision for a Noise Wall anywhere along 290 a WHOLE VILLAGE VOTE. Put this decision on an official ballot for the entire Oak Park Village (All Taxpayers) to cast a yes/no vote. It is only FAIR.
		FHWA Policy changed in 2011, which included voting by benefitted receptors. FHWA updated their noise regulations to ask those directly benefited by a noise wall (receiving at least a 5 decibel noise reduction) to vote for or against a wall's construction (23 Code of Federal Regulations, Part 772.13). FHWA made this decision in order to more fairly reflect the viewpoints of those would receive a direct benefit from the wall. The regulation states: (2) Reasonableness: — (i) Consideration of the viewpoints of the property owners and residents of the benefited receptors. The highway agency shall solicit the viewpoints of all of the benefited receptors and obtain enough responses to document a decision on either desiring or not desiring the noise abatement measure. The highway agency shall define, and receive FHWA approval for, the number of receptors that are needed to constitute a decision and explain the basis for this determination."
245	Isaac	You should build not one extra lane but 3 in each direction do not think about tomorrow traffic but at future traffic you build one lane today and when you are finish you will have to start thinking about building another lane, and this should be done in every express way in the state special in Chicago ???? The worst place to drive from point A to point B
		The Preferred Alternative offers a balance of providing improved operations and mobility in the corridor while avoiding impacts to the neighboring communities. The HOT 3+ lane with variable toll pricing would allow traffic on the HOT lane to be effectively managed to provide a reliable 45 mph trip through the corridor at any time of day.
246	Jackson	Sir, Forward the agenda on above, I saw it in the Sun-Times paper - I am interested in Jan. 26 - event
		The content for the public hearing can be found on the project website www.eisenhowerexpressway.com.
247	Jackson	P.S. Advise who will be the contractors??
		Currently, design (Phase II) and construction (Phase III) of this project are not funded. Contractors for this project, and the method of project delivery, are not known at this time.
248	Johnsen	I live just down the block at 1139 S. Lombard and can attest to how dangerous an intersection this is esp. with the little ones playing in the tot lot and the height of the curb that curves around so quickly. It is very hard to see whether pedestrians or bikers or skateboarders are coming up to the intersection. Please make this intersection more safe as many people with children walk to and from the park as well as walk from the south of OP to the El or businesses on Harrison like the Buzz Cafe.
		In coordination with the Village of Oak Park, several pedestrian improvements are planned for Lombard Avenue. Section 3.1.8.2 of the FEIS provides more information on the proposed improvements to Lombard Avenue. Existing sidewalks that are between 5 and 6 feet wide will be improved to 12 feet wide along the west side and 16 feet wide along east side where the Blue Line CTA station entrance is which can be configured to accommodate a DIVVY bike rack near the CTA station entrance. Pedestrian plaza areas will be provided at each corner of the bridge to improve visibility and provide more space for pedestrian Activities. Connections to the east-west shared use trail, high visibility crosswalks and improved lighting are also proposed. Also, lowering of the Lombard Avenue profile will improve sight lines across the expressway by effectively lowering the existing 'hump' of the bridge over I-290 by 1 foot.
249	Johnson, K.	First thing I was looking at was the ramps at Cicero and at Pulaski and one of the things that I noticed is that they were going to make that dual entry and the ramps appear to be long and my questions and comment had to do with the disabled. Everything is supposed to be accessible for the disabled but when you look at say the entrance at Keeler and Lavergne, you have about 500 feet to go down to the platform. And I'm thinking about a person who is disabled walking with a cane or with a wheelchair, that's a long ramp. And I understand that these were ramps that were closed years ago and my question is: Why were these ramps closed years ago? And why all of a sudden are these ramps, the idea to reopen them, what has changed in the area now that it's being considered to reopen these

#	Commenter Last Name	Comment / Response (*in italics*)
		ramps? What kind of improvements are going to be made? I understand that the areas are going to be covered so that people won't be walking on the outside but then what kind of safety considerations are being considered? That's a long distance. Then there's no bus route on the Keeler and Lavergne Avenue exit. There's no bus running parallel to the El that can get you down to Pulaski and I just wondered if this is the most viable means of accessing those particular exits. I understand that there have been some outreach to the people in the community. I don't live in the community. So if this is something that people who live near there are interested in but just observing it, being an outside observer, these are some of the things that I saw and wanted to bring them to your attention. Again, safety, mobility and all of those things.
		One of the CTA Blue Line Vision Study's recommendations was to provide ADA-compliant facilities at all stations along the Forest Park Branch. ADA accessibility between street level and platform level can be accomplished either by the use of sloped ramps or walkways, or by elevator. It is not always practical to place every ADA access immediately adjacent to a bus stop. The reason that station ramps are sometimes 400 feet in length is that they must adhere to a maximum grade to meet ADA requirements, and the greater the vertical drop between street and platform, the longer the ramp must be. *This comment was forwarded to the CTA.*
250	Johnson, A.	I live by the Blue Line, the Blue Line train, I live about two blocks down. How long they going to do the project, about a year or a couple years? Guess? That's it, no other questions.
		At this point IDOT does not have a schedule for construction. There is only funding for this planning phase, and construction of a new stormwater pump station at the DesPlaines River.
251	Kelly	1043 South Harvey is a block south of the Eisenhower. I'm going to be 70 in June, and I'm wondering how much of this project I have to be concerned about in my lifetime. I am interested in knowing if you have an idea of the best-case scenario of how much time from today this project could receive funding?
		Currently, Phase I is funded, which includes completion of this study. Construction of a new pump station just west of the Des Plaines River which is part of the overall proposed drainage plan for the Preferred Alternative in included in our multi-year program. Other than the pump station, there is no funding for subsequent phases of this project, including design and construction. However, reconstruction of this facility is a priority due to its age and condition. If funding were available, it would take approximately two to three years for design and right of way acquisition; followed by four years of advance construction for items such as railroad bridges, overhead road crossings, and improvements to parallel relief arterial roads; and then followed by four years of mainline I-290 construction.
252	Kelly	How much time between then and funding, and how much time for all of the construction to be completed?
		IDOT has reviewed how construction would occur at a conceptual level, and estimated that it would take four years of advance construction work for items such as railroad bridges, overhead road crossings, and improvements to parallel relief arterial roads; and then followed by four years of mainline I-290 construction. *The next phase of project development is final design, where construction timelines will be studied in more detail and where methods may be found to reduce the construction schedule. During design, IDOT will work with the communities to develop a set of construction measures to manage and mitigate construction effects.*
253	Labuz-Stowers	When it comes to rebuilding the Lombard St. overpass, I urge you to increase the pedestrian and vehicle sight-lines at Garfield St. My daughter and I regularly walk from Barrie Park toward Harrison St. We have narrowly avoided being hit by cars as we crossed Garfield, heading north. Cars on Garfield routinely go much too fast for that street. This intersection sees regular and heavy pedestrian traffic with Barrie Park and the EL nearby. Please make this intersection safer for all pedestrians and vehicles!

#	Commenter Last Name	Comment / Response (*in italics*)
		In coordination with the Village of Oak Park, several pedestrian improvements are planned for Lombard Avenue. The proposed transportation and pedestrian improvements are documented in Section 3.1.8.2 of the FEIS and include large pedestrian plaza areas in all four corners of the intersection, wider sidewalks, high visibility cross-walks in all directions, signals with pedestrian countdown timers, connections to the proposed east-west shared use path, and improved lighting. Existing sidewalks that are between 5 and 6 feet wide will be improved to 12 feet wide along the west side and 16 feet wide along east side where the Blue Line CTA station entrance is which can be configured to accommodate a DIVVY bike rack near the CTA station entrance. Pedestrian plaza areas will be provided at each corner of the bridge to improve visibility and provide more space for pedestrian Activities. Traffic operations will also be improved by overall geometric and turning path improvements, as well as better demarcation between pedestrian and vehicular traffic. Connections to the east-west shared use trail, high visibility crosswalks and improved lighting are also proposed. Also, lowering of the Lombard Avenue profile will improve sight lines across the expressway by effectively lowering the existing 'hump' of the bridge over I-290 by 1 foot.
254	Levrant	In the recently delivered handout, there's a mention of the project affecting the parks on Circle Ave and no mention of the Circle Ave blue-line entrance. What are the proposed changes to Circle Avenue, if any (in both instances)?
		Some right of way will be required from the parcels along Circle Avenue in which Veterans Park the Dog Park resides. The existing sidewalks in this area are 5 feet wide and the roadway width is not adequate for a bicycle lane in each direction. Project improvements will require 770 square feet from the Veterans Park parcel and 575 square feet from the Dog Park parcel which will be used to help accommodate a dedicated bicycle lane in each direction, a 10 foot wide sidewalk east of Circle Avenue, a 12 foot wide sidewalk west of Circle Avenue and a new dedicated bus pull-off area. These improvements will provide safer conditions for pedestrians to access the CTA station from Circle Avenue. The design also proposes the use of retaining walls along Circle Avenue to minimize impacts to the parcels. In addition, both parks will have direct access to the proposed shared-use path that will extend from Des Plaines Avenue to Columbus Park. The path connections will require some temporary construction easements but no permanent impacts are proposed. At the Blue Line entrance, the proposed condition includes a modernized CTA station at Circle Avenue. The station design specifics will be completed by the CTA in future studies. Geometric improvements at Circle Avenue include a 16 foot wide sidewalk in front of the station compared to 5 feet in the existing condition. The wider sidewalks, dedicated bicycle lane and dedicated bus pull-off area will provide a safer design and improve pedestrian mobility at this location.
255	Levrant	Also, how will the HOT lanes be monitored for occupancy?
		Enforcement and other operational characteristics of the managed lane will be developed during Phase II (final design). Based upon current national experiences, the likely methods include a combination of police enforcement, video cameras, and other potential technologies, such as transponders with carpool indicators.
256	Lococo	In historical perspective, the original intent and purpose of the inter-state highway system was to connect American cities. This was the vision of General, later President, Eisenhower; to stop at the outskirts of cities: 1957. What was done instead was the carving up of cities and residential neighborhoods; we cannot put the toothpaste back into the tube.
		Thank you for your comment.
257	Lococo	But what we can do is restore, as much as possible, of the original intent. Frontage roads must use cantilever wooden bicycle paths, elevated 10 feet above the surface. Cantilever construction will 1) save precious space; 2) enable two-way bicycle journeys. At one-half mile intervals, a descent to the surface by gradual angles of decline. This will enable both local travel and long distance journeys for the fit and hardy. The bicycles could be tandem as well as solo. Think outside the box, cantilever wood path-ways endure.

#	Commenter Last Name	Comment / Response (*in italics*)
		The Preferred Alternative preserves all of the existing frontage roads, and provides a new multi-use trail from Des Plaines Avenue to Austin Boulevard that is at grade, and connects the Illinois Prairie Path to the west to the Columbus Park trail on the east. No cantilever designs were necessary in creating the multi-use trail, and a cantilever design would also be a greater maintenance challenge.
258	Luke	This proposal is a waste of taxpayer money. I would suggest that those responsible for making the final decision re-familiarize themselves with their college 101 planning textbooks, and with the law of induced demand: An excerpt from Suburban Nation: The Rise of Sprawl and the Decline of the American Dream (Duany, Plater-Zyberk, Speck, 2000), " The simple truth is that building more highways and widening existing roads, almost always motivated by concern over traffic, does nothing to reduce traffic. In the long run, in fact, it increases traffic. This revelation is so counterintuitive that it bears repeating: adding lanes makes traffic worse. [...] The mechanism at work behind induced traffic is elegantly explained by an aphorism gaining popularity among traffic engineers: "Trying to cure traffic congestion by adding more capacity is like trying to cure obesity by loosening your belt."
		I-290 is a vital transportation corridor that serves over 200,000 vehicles per and that connects people, communities and employment centers. I-290 experiences thousands of crashes, and the proposed improvement will improve safety and mobility for all users. Eighty percent of the construction cost is to reconstruct the existing facility, and only 20 percent is for additional capacity. I-290 is in a mature urban area and induced demand is addressed through the No Build and Build forecasts which show a relatively minor increase in traffic volumes. The introduction of a managed lane such as the HOT 3+ lanes of the Preferred Alternative will provide a reliable trip by managing use via variable priced tolling, while allowing vehicles with 3 or more occupants and transit vehicles to use the lanes for free. This encourages maximizing occupancy per vehicle and reducing the amount of vehicles on the road for a given person throughput. The HOT 3+ lanes would provide travel time savings of up to 56% and the remaining general purpose lanes would provide up to 25% time savings based on 2040 projections.
259	Luke	This will not relieve traffic congestion. However, it will make the area more dangerous, less prosperous, and less healthy. It will only enrich those who build it. It is a bad idea and I'm strongly opposed to it.
		The introduction of a managed lane such as the HOT 3+ lanes of the Preferred will provide a reliable trip by managing use via variable priced tolling, while allowing vehicles with 3 or more occupants and transit vehicles to use the lanes for free. This encourages maximizing occupancy per vehicle and reducing the amount of vehicles on the road for a given person throughput. The HOT 3+ lanes would provide travel time savings of up to 56% and the remaining general purpose lanes would provide up to 25% time savings based on 2040 projections.
260	Manuele	I reside one and one half blocks north of the Eisenhower Expressway. I was a career commercial property insurance adjuster, and I can personally attest to the severe impact that such a proposed major expansion project will have on the surrounding residences and general community. The sustained concussions from the proposed construction will fracture the underground infrastructure, especially the sewage system. Most of the residences were constructed with plaster, and there will be severe fissuring from such sustained concussion. As I stated above, as a property insurance adjuster I have had direct experience in evaluating such damages. IDOT should be placed on notice that they will be required to consider claims for such resultant property damage. Also, the noise and dust will severely impact the surrounding community. More consideration needs to be given to these consequences of the proposed construction.
		In Phase II (final design) IDOT will work with the local communities and stakeholders to develop and implement strategies to minimize/mitigate construction effects. This will include development of specifications to address noise, dust, time of work, and materials storage within the context of the community. Also, IDOT will coordinate with the communities to develop a scope of work for an overall monitoring program to address vibration/settlement concerns. However, the execution of the program, beginning with condition surveys of buildings, would not be initiated until closer to the time of construction.

#	Commenter Last Name	Comment / Response (*in italics*)
261	Matthews	The Ike is congested most of the day because of a few bottlenecks, so adding an additional lane in both directions is nice. However, increasing lanes in the 3 to 4 bottlenecks (I-88 split, near Austin/Oak Park, before Kostner, and curvy lanes west of Route 171) could decrease traffic jams allowing the traffic to flow more smoothly throughout the day. The CTA rail system has unused space adjacent to tracks. You could possibly create flyover lanes to increase capacity where areas are too narrow to expand.
		The Preferred Alternative adds a lane in each direction from Mannheim Road to Austin Boulevard, effectively eliminating the existing 4 to 3 lane bottleneck in each direction. Our analysis indicates that travel times will improve by 25% in the general purpose lanes and by over 50% in the HOT 3+ lanes. The CTA is planning to modernize the Blue Line and provide wider platforms in this area, so much of the existing available space will be required for CTA improvements. However, the Preferred Alternative will utilize up to 10' of the vacant CTA Blue Line ROW between Circle Avenue in Forest Park and Austin Boulevard in Chicago to accommodate the additional lanes and wider shoulders.
262	McCormack	Thanks for calling them "crashes" and NOT "accidents."
		Thank you for your comment.
263	McCormack	The Hillside backup, where the two expressways meet, is caused by high traffic volume and distractions. The more done to reduce both, the better. Obviously more lanes over a prolonged period is preferable (and most expensive).
		Thank you for your comment.
264	McMillen	I am a retired lawyer with a primary residence in Oak Park (closer to North Ave. than to the Eisenhower Expy.) and a second (condo) property in the city (South Loop). I am writing to ask you to reconsider the Preferred Alternative Plan in light of the criticisms made by Citizens for Appropriate Transportation, to which I add the following comments: The best way to facilitate commuter traffic from exurbia is to improve public transit, especially by extending the Blue Line west from Forest Park (and/or adding high-speed rail facilities to the mix now available for exurban dwellers). I say this as a former daily commuter who always chose public transit over automobile, and still usually choose it for my less frequent travel between Oak Park and Chicago (either using CTA bus #86 from my home to the Ridgeland Ave. green line station or parking my car in an Oak Park public lot; formerly, when I owned a home in SE Oak Park, i took the Blue Line from my home to the city, and to classes and events at UIC). My reasons for this habit have included: cost and inconvenience of maintaining a personal automobile; a long habit of reading and/or working on the train; cost of parking in the city (before I purchased a parking space near my condo); and my interest in not adding to air/soil/water pollution in our state.
		An extension of the Blue Line to Oak Brook was evaluated in the Round 1 Single Mode Alternatives analysis and did was found to have insufficient diversion of traffic from I-290 to transit, and did not result in any travel performance improvement to the I-290 Expressway (see Section 2.3.3.1 of the FEIS). Additionally, this extension drew a considerable amount of riders from other existing transit services. For these reasons, an extension to Oak Brook was not carried forward. However, of the new regional transit trips generated on extension to Oak Brook, 89% of the new transit trips were generated between Forest Park and Mannheim Road. Therefore, the Preferred Alternative is configured to accommodate a High Capacity Transit extension (such as the Blue Line to Mannheim Road). Since I-290 is an existing facility, the addition of one lane in each direction for a portion of the project's length, along with the minimal new right-of-way required, is not anticipated to cause substantial impacts to environmental resources. For example, the improvements of the Preferred Alternative are projected to have very little change in air quality, with a slight reduction in the various air pollutants (-0.07% to -0.30%) and Mobile Source Air Toxics (-0.08% to -0.20%) as compared to the No Build Alternative (see Table 5-1 of the FEIS).
265	McMillen	The many studies reported by CAT (and others) have shown that expanding/building more highways (and deprivileging other land uses—whether agricultural/open space/recreational, residential, commercial, etc.) does NOT solve the problems of highway congestion

#	Commenter Last Name	Comment / Response (*in italics*)
		or even safety. Rather, it seems to lengthen commutes for workers, who move farther and farther away from the city in order to "breathe clean air," exacerbating their own (and my/everyone else's) problems.
		I-290 is a vital transportation corridor that serves over 200,000 vehicles per and that connects people, communities and employment centers. I-290 experiences thousands of crashes, and the proposed improvement will improve safety, mobility for all users. The HOT 3+ lanes would provide travel time savings of up to 56% and the remaining general purpose lanes would provide up to 25% time savings based on 2040 projections. The Preferred Alternative will also create $2.7B in productivity savings.
266	McMillen	As I have aged, I also have grown to feel safer in a train or bus (when I'm not driving), and to enjoy the interaction with younger people who ride trains in and around the city. Perhaps I should add that I am a middle-class white woman; also, that the more IDOT and CTA can do to encourage people like me to ride the trains/busses, the safer I'll feel—it's nice to have a critical mass when traveling, especially at night.
		The proposed improvements as part of the Preferred Alternative and those outlined in the CTA Blue Line Vision Study are intended to make the service more accessible, reliable, and attractive, and should promote increased ridership.
267	McMillen	Before I moved to Oak Park, I lived most of my life either on the North Side of Chicago or northern suburbs, with 3 years in Hyde Park (law school); thus, my feelings about public transportation vs. automobile travel were molded long before I had regular encounter with the Eisenhower Expy, whose design as it passes through Oak Park is, of course, different from that of the Edens or southbound urban expressways. However, so are our (west suburban) communities; as infill continues to increase our populations, we must be thinking of long-term solutions, not just patches to the existing highway system.
		The I-290 Study Area, and much of the adjacent areas, are maturely developed areas with limited potential for infill development. Consequently, population and employment projections for the Study Area show a projected 0.4% increase in population and 0.5% increase in employment within the I-290 Study Area for a build alternative, as compared to the No Build Alternative, by the year 2040, per Section 3.1 of the FEIS. The Preferred Alternative provides not only more efficient management of traffic demand along I-290, but also improves non-motorized connections across I-290, a new east-west multi-use path connecting Des Plaines Avenue with Austin Boulevard and providing connectivity between the Illinois Prairie Path and the Columbus Park southerly path, improved access to CTA rapid transit stations, free access of the HOT 3+ lanes to transit vehicles and vehicles with 3 or more occupants, and space to install a future transit extension west of Forest Park.
268	McMillen	In short, I prefer to have my tax monies used to improve transportation options that will serve all of northern IL, not just wealthy exurban car owners.
		It should be noted that the reverse commute on I-290 toward the western suburbs is almost as heavy as the traditional commute into downtown Chicago, so that the travel improvements of the Preferred Alternative will be distributed to users in Chicago and the near western suburbs as well as those of more outlying areas.
269	Miller	I live five houses from the Eisenhower. I am appealing to you to abandon the plans indicated in your latest report. Your group has spent too much money and too many hours deciding on things that will negatively affect the people and properties that adjoin the Eisenhower. Remember the phrase "build it and they will come"? That is what will happen with toll lanes. People already pay extraordinary prices to park their cars downtown; the tolls will not make a difference. The toll lanes will be filled and the other lanes will be filled and the Eisenhower will be the same. It will be the same air polluting, congested mess it always has been. One more lane each direction will not make a difference.
		The overarching need is to reconstruct I-290, as it was originally built in the 1950s and many elements are at the end of their useful service life. Approximately 80% of the cost of the I-290 reconstruction is to replace and modernize the existing pavement and bridges, and approximately 20% to construct the new HOT 3+ lanes and other improvements. The flow in the HOT 3+ lane would be managed

#	Commenter Last Name	Comment / Response (*in italics*)
		through variable toll rates that would rise and fall depending upon the level of congestion, and in doing so, provide a minimum 45 mph speed in the HOT lane. The Preferred Alternative will provide travel time savings of up to 56% in the HOT 3+ lanes and up to 25% time savings in the general purpose lanes based on 2040 projections. The Preferred Alternative will also create $2.7B in productivity savings.
270	Miller	Your information is misleading. I believe you will be encouraging even more drivers to take their cars downtown rather than riding public transportation. I also do not believe the number of crashes you report to occur yearly. I also do not believe the number of accidents you claim to occur at the Austin and Harlem exit/entrances.
		The addition of lanes between 25th Avenue and Austin Boulevard removes a bottleneck where traffic backs up at the upstream end of the lane reductions. There will be no added lane east of Austin Boulevard, and the conversion of the inside lanes to HOT 3+ lanes will encourage carpooling and promote bus transit in those lanes. The crash data was taken from actual local and state police reports of crashes where property damage, injuries or deaths occurred.
271	Miller	I hope you do not get the funding. I hope you do not cause construction horrors for years for ALL drivers. I hope you do not jeopardize the Oak Park Conservatory, our homes and businesses. I hope you do not make the air any worse than it already it is. I hope you don't risk the stability of Garfield and Harrison Streets. I hope you and your plan do not succeed.
		Thank you for your comment.
272	Montville, F.	I have lived on Garfield, east of Harlem for over 40 years. I really hope that I-290 is not converted into another tollway, Single HOT or otherwise.
		Thank you for your comment.
273	Montville, J.	One of my first questions we have a son who's disabled, he's 42 years old now. So there have been many occasions when there was time when I had to take him in the wheelchair on the CTA and it came about -- I don't know exactly when it was closed off but anyway, at the medical center there is a ramp that goes up towards I think it's Pulaski, but there's a turnstile there, not exactly accessible. When you get off the train, however, there's a stairway that will take you up. If I wanted to use another stop that has a ramp on it, I would have had to have gotten off at -- I got off at Damen, but if I had need of the ramp, the stop before it, is that Ogden if you are going east of Damen? The largest issue is the medical center Blue Line stop ADA accessibility.
		Currently, the UIC-Halsted, Illinois Medical District, Kedzie-Homan, and Forest Park stations on the CTA Blue Line Forest Park Branch are ADA accessible. At the Illinois Medical District station, Damen has a long ADA-compliant ramp, but it is currently closed for construction. The Paulina end is open and is at least temporarily ADA-accessible. The Ogden station house will get an elevator as part of the renovation project currently under way.
274	Montville, J.	And the other thing was that I wanted to be able to get a little bit more information about the wall. We live at 900 South Winona. So we live three blocks east of Harlem. So we have Volvo and the post office and we live just catty-corner from the mail drop-off, postal mail drop. My question is: Where is the wall going to go? Because I think 52 percent said yes, so I figure -- is it going to go right along the highway, the expressway, or is it going to be built higher because there's like a big hill. There's a hill. Here's the post office, and then it drops, okay? (Indicating.) Whoever is reading this will know what I'm talking about, okay? I do want to find out about that. And if the trees are going to be cut, the existing trees that are up on that line, are they going to be cut? Okay. Those are the big ones. What kind of material are they using for the walls? There's always accidents on the Eisenhower. When there are accidents, there's always -- we have lived there for 40 years, so I know a lot about this. There's usually somebody from the fire department who stays above like on Harrison side or the Garfield side to observe what's going on down there, what's going on down there with the fire trucks and with the accident. Is this wall going to impede the ability for that person because I'm assuming that this man is a crucial part of the whole crew if there's an accident -- when there's an accident. I would like a reply to these questions.

#	Commenter Last Name	Comment / Response (*in italics*)
		The wall by your home is wall B30. B30 would be located at the top of the slope of as you indicated. The vote results from this wall were 52% not in favor of the barrier. IDOT requires that more than half of potential votes received must be in favor in order for the wall to be recommended for construction. Since less than half of the potential votes received were in favor, the wall is not recommended for construction.
275	Nudelman	While this project would help alleviate current congestion, I feel there are more pressing transportation issues today. One of these issues, especially in the near western suburbs of Chicago, are the amount pf grade crossings. Grade separations typically cost between $10-30 million; this project is currently budgeted at = $2.3 billion. For that cost, 76-230 grade crossings could be eliminated, and/or roads and bridges could be repaired. Grade crossings elimination along Harlem Avenue, 1st Avenue, Cermak Road and Grand Avenue would be beneficial to all road users. Freight traffic would have freedom of movement, and private vehicles and PACE/CTA buses would be much more reliable. The CREATE program is a great start, and adding more grade separations would improve the network for all users. Suggested separations: Grand/76th, Elmwood Park - Grand/Fullerton/Harlem, Elmwood Park - Harlem/26th, N. Riverside - Harlem/34th, Riverside - Harlem/63rd, Summit - Cermak/1st, N. Riverside - Lake/1st. Maywood - Grand/Thatcher, River Grove - Cermak/Cicero, Cicero - Cermak/Laramie, Cicero - Lake/5th, Maywood
		I-290 is a vital transportation corridor that serves over 200,000 vehicles per and that connects people, communities and employment centers. I-290 experiences thousands of crashes, and the proposed improvement will improve safety, mobility for all users. This facility was originally constructed during the 1950s and is now at the end of its useful service life and is in need of reconstruction based upon its condition alone.
276	Nudelman	I heard that the cost of the project is roughly $2.3 billion. I am currently a commuter on the 307 bus route on Harlem Avenue. That bus route has four railroad crossings at grade. I realize this project is very valuable for expanding capacity. But in terms of importance, I think the immediate need right now is separating some of these heavy, congested train crossings. I understand that the CREATE Program is doing that, but I think more funding should be applied to railroad grade crossing separations.
		The Eisenhower Expressway reconstruction is one of many projects that needs to be accomplished in the region. It is still a very important project because of the role it plays with connecting communities to the region as well as connecting the region with the communities along the I-290 corridor. *The nearly-completed 25th Avenue grade separation project, as well as other CREATE projects, have improved travel in the region, and the process of providing grade crossing separations will continue. At this point in Phase I studies, IDOT is identifying what the scope of work would be for the Eisenhower Expressway; identifying funding will also be part of that process.*
277	Oliverio	Hyperloop in the center of the Eisenhower going east and west! Buy the Mannheim strangler land next to CarMax and expand the parking lot into a humans, cars and cargo Hyperloop above the streetlights. In between the streetlights along the Eisenhower build beams in between to hold the structure. You will enter at Mannheim and the top of the old main post office will be redesigned to let passengers exit to Congress! The hypersonic train system will be a 30 second ride compared to a 30 min-2 hour bumper to bumper idle wasting gasoline so the oil companies can jack up a gallon to $5! Hyperloop! Hyperloop! Hyperloop!
		The impacts and cost of building a structure over I-290 would outweigh any potential benefits.
278	Oliverio	Arrest Rahm, Rauner, Madigan and Durbin and the rest of the low lives making Illinois worst state 3 years in a row and #1 in violence more than LA and NY combined!
		Thank you for your comment.
279	Oliverio	I think it is common sense that if Ia is going to improve their highways with Elon Musk than Chicago 290 should dig batman tunnels as well Mannheim to Congress into lower Wacker Drive! Elon Musk we will put a toll to support the project at Mannheim and we will take

#	Commenter Last Name	Comment / Response (*in italics*)
		the O'Hare oasis identical model for truckers before 294 and anyone not from Chicago to have an illuminated lit up oasis safe zone weather emergencies as well. We will begin digging underground before la because Chicago is more original gangster than la. When I become mayor in 2019 I will make it a priority for all 3 million + Chicagoans to have a Tesla and space x engineered underground pass road to our magnificent architectural grandmaster piece! Elon Musk is in negotiation with Rahm Emanuel as of today right now! We can even carpenter ant dig a pass road to Lake Street underground! Power construction and Walsh leading the way along with every other top construction team in Illinois and we can revolutionize transportation of humans for centuries to come. Less gasoline wasted. Less engines sitting in idle. Less oil and emissions! No speed limit! Go as fast as you want no traffic!
		Thank you for your review and comments.
280	Oliverio	Uber flying car taxi's and Google Maps Wonkavator's will also help cut down on traffic besides the Hyperloop hypersonic train going east and west. Uber should buy up every single flying car that's 4 stars for taxi service. Google should create pods. Almost like bus stop stations. You enter the Wonkavator and type in your Google Maps destination and it will quadrocopter you to the closest Google Wonkavator pod station to the destination you entered. I think USA is primitive in their transportation. Lazy fat ____ politicians that truly don't care about our nation. The Atlantic and Pacific is free water to transport humans! Take the salt water and create water coasters and float humans in tubes through cities?! Why does California not have splash mountain water coasters not only for transportation but tourism?! Florida should be #1 with the engineers from Disney and Universal their entire infrastructure should be shooting humans in water coasters around the city funneling as much salt water through the tubes. Chicago water coaster would not be viable because of the months of frozen temperatures but the temperate climates in certain east and west coast states should 100% use this. Could you imagine hopping in a Jetsonian glass or hard plastic enclosed water pod and float around the city. Eric Garcetti should be more progressive along with Gov. Rick Scott. Another option as well are ant hole underground Hyperloop if Chicago didn't want to build about the Eisenhower. Elon Musk wants to dig highways underground but even that seems primitive. Why not build underground Hyperloop tubes all over USA, Mexico and Canada. An entire hypersonic train system developed all under the earth. Anything but the CTA and 3 lanes at Mannheim converging to an eternity of miserable strangling traffic until Austin 4 lanes. How humiliating Rahm has not been more proactive regarding our transportation. China is crushing us in speed so is Japan and even Russia. We are losing USA! This is a fact! We are behind in the #1 category for more free time and autonomy for humanity! When your commute time is cut in half to work that leaves half that time designated to the human's desires and passions instead of the slave, servant, peasant serf lifestyle they are forced into because of capitalism! Thank you!
		The impacts and cost of building a structure over I-290 would outweigh any potential benefit.
281	Oliverio	Think an extra lane is common sense. 4 lanes throughout Mannheim to Austin connecting. Mayor Emanuel should have finished that in his 1st term!
		Thank you for your comment.
282	Oliverio	I think we need to clean up all the exits when you first get off the highways on the exit ramps! They are so boring and not kept up with at all! Rahm is an art major! Steel pieces on the corners to represent the territory! Flowers? Plants? Landscaping of any kind? I think Rahm should let keim brick staining make the most beautiful murals along the east and west Eisenhower! Philips color kinetics led light strips along the highways and more creative unique digital billboards!
		IDOT will develop an aesthetic approach for the project in the next phase of project development. Depending on the local aesthetic features desired, local communities may need to participate in the additional costs of the requested aesthetic features.
283	Oliverio	Hover cars are another form of transportation to avoid ever having to fill miserable sink hole pot holes after a harsh winter snow and salt plows to the streets. Magnetic strips on the streets that hover and google maps controls the track self-driving hover pods. Like what George Jetson flies in but don't allow them to hover more than a few feet. Larry and Sergey can engineer and figure that one out alone

#	Commenter Last Name	Comment / Response (*in italics*)
		with the Quadrocopter Wonkavators! The Wonkavators would be so amazing to walk outside your home and see humans floating in a clear pod to their destination of choice.
		Although the transportation planning process strives to consider foreseeable conditions through the year 2040 planning horizon, major market penetration and adoption of future transportation modes such as hover cars and hover pods are likely beyond the planning horizon for this study.
284	Oliverio	Maybe a McDonalds oasis above like Hinsdale oasis? A new oasis of food $ yelp foodie GSR's instead of stopping in the hood at a Church's Chicken! Take one of the abandoned overpasses at an exit where a parking lot and gas station can be made accessible. Mannheim oasis is perfect with the parking lot next to CarMax available. Use that land and create jobs in Hillside which is so low poverty around there and land just waiting to be penetrated! The Mannheim oasis will be built right there I can see it now! For all the semi-trucks before they get on 294! Create jobs for Christ's sakes!
		No oases are planned for the I-290 project.
285	Oliverio	Let's add a toll at the Mannheim oasis! More toll $! Add one to 83 north and south and 53 north and south the pass roads toll free! Make as much $$$ as you can off these peasant, servant, serf and slaves of Illinois. The tolls will pay to build out the Mannheim oasis along with Starbucks, Dunkin Donuts/Baskin Robbins, McDonalds, Subway, Chick-Fil-A, Panera, Chipotle, Blaze Fire Pizza, Portillo's, glazed, infused! The truck drivers should fill up gas before their haul to Indiana and enjoy the best rated QSR for antibiotics in their meat a, b, c rated. I think that would be really nice for Chicago and tourists.
		Thank you for your comment.
286	Oliverio	I think the old main post office update is fantastic for Chicago. What an eyesore to drive into an $8 billion dollar TIF funded city of 3 million and see that blinding sight! Ughhhh a wave of intuitive repulsion!
		Thank you for your comment.
287	Oliverio	CHICAGO BEARS have the opportunity to become number 1 franchise in all of American sports surpassing Jerry Jones and the Dallas Cowboys franchise. The Green Bay Packers are the only community owned athletics franchise in American professional sports. Currently as it stands the Chicago Bears are No. 8 with a current value of $2.45 billion dollars. In 2014 their revenue was $352 million dollars with an operating income of $86 million. Green Bay Packers are No. 10 NFL franchise with a current value at $1.95 billion dollars. Their revenue was at $347 million in 2014. Also in 2014 their operating income was $63 million dollars. There are only 104,779 citizens currently living in Green Bay, Wisconsin versus Chicago, the third largest city in the nation at 2.719 million citizens to support our cities team franchise. Rather than being the property of an individual, partnership or corporate entity, they are held in 2014 by 360,584 stockholders. No one is allowed to hold more than 200,000 shares; approximately 4% of the 5,011,557 shares currently outstanding. It is the broad-based community support and non-profit structure which has kept the team in Green Bay for nearly a century in spite of being the smallest market in all of North America. With Los Angeles stealing the St. Louis fans market the Ram's fans are looking for a new team to attach their loyalty and more importantly their cash and credit cards too! The Lucas Museum cost the city of Chicago $743 million dollars and billions in tourist revenue for our city. I would like to turn this tragedy into opportunity and speak to FOTP about utilizing the landscape to build an additional viewing only stadium for Bears games in place of a "PARKING LOT." If Friends of the Park want a % to build their parks they will receive the demands George Lucas would not meet for the Star Wars museum. If the Chicago Bears organization decides to go public I suggest they offer initially $1.6 billion dollars in shares with NO LIMIT to how many shares you can hold. First come first serve. The revenue we will receive along with the McCaskey's staying majority owners purchasing $2.45 billion in shares can create thousands of real jobs for the Southside of Chicago and Near South region. With UIC Roosevelt and Near South having almost $1.5 billion in TIF funding this stadium will only add to the booming Chicago areas and the multiple high rises still being built. With an ever growing city of Chicago we must feed our citizens. Imagine a stadium with every

#	Commenter Last Name	Comment / Response (*in italics*)
		edible desire and craving you can ever have is all in one spot. Imagine visiting every NFL stadiums top concession on one concourse level. Imagine the Taste of Chicago gluttony and madness every home game. The city of Chicago will greatly benefit from this new venue with a sense of pride and tradition. This venue will be a 30,000 capacity $20-$30 viewing stadium and 24 hour fresh foods market similar to a Reading Terminal Market in Philadelphia, Pa. I suggest we take Bob Iger, the CEO of Disney, and his beautiful neo futuristic LA Stadium that was denied by Roger Goodell. Structurally we will build a skywalk with a walking escalator that will connect to the Southwest corner of the stadium. Your ticket will scan you into Soldier field, Barracks Stadium or both. All soldier field ticket holders will have access to both stadiums. We will take the upper deck level of the proposed LA stadium off and two levels will have a different array for a 24 hour food market. One level will showcase the 32 NFL team's top 3 best of the best concessions fan voted. The other level will have all 4 and 5 star Yelp restaurants and pop ups from all 195 countries. Once the $1.6 billion shares sell out which they will the McCaskey's will receive an extra $500 million to their personal net wealth and the $1.1 billion will go towards Soldier Field updates. The Chicago Bears are one of only 6 teams that do not sponsor its stadium. To raise extra funds Barracks Stadium can also have a Corporate Sponsorship attached perhaps a non-profit organization like United Way or Salvation Army. CHICAGO BEARS will not only collect revenue off of Bears Games and concessions but will also have constant streaming venue in their 24 hour fresh foods market. Barracks Stadium will host sporting events, live nation concerts, musicians, plays and more. The 24 hour fresh food markets will have the Soldier field suppliers fund this food source along with Sysco, Marano foods, Greco foods and more purveyors. These food suppliers will give us products from all 195 countries for all citizens of the Republic to enjoy their cultural traditions from the lands they once occupied and called home. America is now home for all of us but traditions and customs specifically when it comes to food and drink can unite a city in brotherly love. The entertainment of football along with the desire for alcohol and food is what brings in the crowds year after year to support the Bears. With the Bears being the smallest stadium in the NFL at 65,000 capacity it will not turn into the number 1 at 95,000 beating ATandT stadium in Dallas by over 10,000 fans. When a touchdown is scored and points are on the board you will hear the roar from the Barracks outside where our Chicago soldiers will be stationed enjoying the victory. We will build a new parking structure to make up for the lost parking lot for fans and tailgating. We will set up a user friendly in and out common sense no traffic flow out of the Near South area. This will allow an amazing tailgate experience for our loyal fans that enjoy setting up a tent, grill and cooler and partying hours before the show. CHICAGO BEARS is looking to raise $1.6 billion dollars through public shareholders. Listed below are line items that the investor's investment will be dedicated towards. • $500 million for the McCaskey's• $500 million into Barracks Stadium• $500 million to pay out shareholders• $100 million Soldier Field Updates and add one We plan on reinvesting 60-70% of all profits back into the company in order to ensure growth of the company on a yearly basis. The remaining 30-40% will be dedicated towards investor payouts.
		Thank you for your comment.
288	Oliverio	The #1 change I would like to see for the Eisenhower is 0 shootings ever again in this sickening reality! I have driven my big target body on the highway thousands of times especially with Uber. My family and friends and all of us here drive that highway to enter Chicago from western suburbs DuPage County! There should not be mentally ill brain damaged humans sniping random cars and murdering people Rahm Emanuel?! This is not grand theft auto! This is not a video game fools play life is a game this is supposed to be a beautiful colorful illuminated fantasy dream not your nightmare! Anyone caught shooting someone off the highway we kill immediately eye for an eye! Driving your car to your destination is a human right all humans deserve to safely enter and exit their vehicles on our most heavily populated highway in the center of America!
		Thank you for your comment.
289	Orzel	First of all, I think that changing the four free lanes to three free lanes and a HOV lane east of Austin is going to have a very negative public relations impact on the whole project. I think people are going to see it as another way that the government is trying to take money from them and create a toll situation on a free expressway and it will actually reduce the number of free lanes you can drive in.

#	Commenter Last Name	Comment / Response (*in italics*)
		I-290 is a very constrained urban corridor with very limited space for capacity improvements. The HOT lane, along with eliminating the 3-lane bottleneck, will improve efficiency of the entire corridor, including the existing four lane section east of Austin Boulevard. Within the context of the I-290 study, the basic purpose for the HOT lane is to manage travel flow and provide a reliable trip, rather than generate revenue. The HOT lane will be managed through variable toll prices that will rise and fall depending on the level of congestion, which will maintain a minimum 45 mph speed in the HOT lane. With the addition of the HOT lane, speeds in the three General Purpose lanes will improve by 25 percent. *Subsequent Phase II (design) engineering and financial studies will determine potential tolling policies for the HOT lane. Currently, there is no funding committed for design or construction of this project.*
290	Orzel	Finally, I sincerely hope that we don't have walls, at least in Oak Park. But the situation now where there are walls some places and walls not looks ridiculous. So I hope there's a decision one way or the other, although I would prefer not to have walls at least in Oak Park because you are splitting Oak Park into two sections.
		A final decision with respect to the installation of noise abatement will be made during the Project's final design phase ("Phase II") and the public involvement process. Before the initiation of noise wall related work in Phase II, the Department and the Village will assess whether public sentiment has changed, either due to a substantial time lapse since the noise wall vote in 2016, or changes in noise wall technology or policy that alter the composition of the walls. If it is jointly determined that there is a change in public sentiment, a new vote that obtains the viewpoints of the benefited receptors will be held.
291	Orzel	Second of all, as someone who lives at 834 South Clinton, I am very concerned about whether or not I'm going to be able to sleep for two or three years while construction is going on, and I'm worried about damage to my property from the vibrations of the construction and I don't think that that has been addressed properly.
		During the design phase (Phase II) IDOT will coordinate with stakeholders with respect to managing and mitigating construction effects, including a monitoring program to address vibration/settlement concerns. The start of the program, beginning with condition surveys of buildings, would be initiated prior to the time of construction.
292	Peterman	I have reviewed the Draft Environmental Impact Statement released for public comment on December 30, 2016. My comments will focus on two sections of the Statement, S.5 – Environmental Resources, Impacts, and Mitigation and Appendix D – Environmental Justice Methodology Technical Memorandum. Based on my analysis, I conclude that while the Draft EIS has complied with Executive Order 12898 it fails to consider the broader issue of environmental equity by not offering an option for more extensive public transportation in the I-290 corridor.
		In general, the purpose of the I-290 planning process is to address the transportation needs within the study area, rather than a targeted initiative that is solely focused upon transit improvements. The I-290 planning process included the participation of the region's transit agencies, and specifically, a partnership with CTA regarding the development of a Vision Study for the Forest Park branch of the Blue Line. It is also important to note that an extensive transit network exists within the study area, and 21% of the work trips use transit in the study area, as compared to 12% in the rest of the region. In addition, as part of the I-290 planning process, transit alternatives were studied in depth and coordinated with stakeholders. The Preferred Alternative contains transit improvements, including a recommendation for a high capacity transit (CTA Blue Line) extension with the reservation of space for this future CTA Blue Line extension. In the interim, express bus service in the managed lane is accommodated. In addition, access to the existing CTA Blue Line stations would be improved through new bus pull-outs, bus stops relocated to better align with the existing stations, wider sidewalks, improved intersection cross-walks, a new east-west shared use path, bicycle lanes, and ADA improvements. While the CTA has indicated that a Blue Line extension is a relatively low priority for their agency, the other important issue is that approximately 50% of

#	Commenter Last Name	Comment / Response (*in italics*)
		the ridership for a Blue Line extension would consist of diversions from other existing transit services, which indicates that there is currently a lack of supportive land use to justify a heavy rail extension.
293	Peterman	The two sections of the Draft EIS, S.5 and Appendix D relate to Executive Order 12898 of February 11, 1984 and address the issue of environmental justice in minority populations and low-income populations. The data, the analysis, and the discussion are thorough and complete with respect to the Executive Order. I find no problems with the analysis and agree with the conclusion of no disproportionately high and adverse human health or environmental effects of the proposed reconstruction of I-290 on minority and low-income populations. That is, both minority and low-income populations will not suffer from the impacts of construction and from the reconfigured expressway any more than the general population. However, this finding is quite narrow, addressing only the issues covered in Executive Order 12898.
		The analysis was completed to meet the requirements set forth in E.O. 12898 and associated implementing guidance set forth by the USDOT. *As noted in your comments, the DEIS documents that there are no disproportionate impacts to low income or minority communities. In addition, many aspects of the preferred alternative would be beneficial to individuals that do not own a car, including: congestion relief on nearby arterials and the I-290 corridor (which would improve the performance of buses), improved transit connections at CTA stations, improved bike and pedestrian accommodations (including a 2 mile extension of the Prairie Path), and the encouragement of carpooling (the HOT lane would allow carpoolers to ride toll free, and would benefit from a 56% reduction in travel time).*
294	Peterman	Since this order was issued in 1984 much work has been done exploring how minority and low-income populations are disproportionately impacted by transportation policies and actions resulting from them. Specifically, what is meant by environmental justice has been expanded to include the notion of environmental equity. According to researchers at the Civil Rights Project at Harvard University, an equitable transportation system should, among other things: Distribute the benefits and burdens from transportation projects equally across all income levels and communities; Provide high quality services – emphasizing access to economic opportunity and basic mobility –to all communities, but with an emphasis on transit dependent populations; and Equally prioritize efforts both to revitalize poor and minority communities and to expand transportation infrastructure. Neither the Draft EIS nor any of the proposed alternatives for I-290 address these points. There has been a failure on the part of the planners to address all aspects of environmental justice, especially to relating to equity. In the end should I-290 be reconstructed the existing transportation inequities will continue to exist.
		Section 3.1.9 Environmental Justice of the I-290 DEIS includes an access and mobility analysis of the EJ populations in the I-290 corridor including access to regional employment centers, transit service, non-motorized facilities, and improvements to arterial traffic conditions.
295	Peterman	My conclusion that the proposed I-290 project does nothing to address the issue of an inequitable transportation system is based on my determination of how many households in the minority and low-income populations located just to the north and south of I-290 would not receive any benefits from the proposed alternatives. I do this by using the most recently available data from the American Community Survey (U.S. Census) both in its raw form and as summarized by several different organizations in the Chicago area. Specifically I identified the percentage of households lacking direct access to an automobile. The data show the percentage of households lacking access to an auto in the eighteen Chicago census tracts extending eastward from Austin Boulevard and adjacent to I-290 ranges from 21% (tract 2605) to 55% (tract 8430). The average percentage of households without an auto for the 18 census tracts is 36.7%4. By contrast, the percentage of households lacking access to an auto in the communities along I-290 and west of the city of Chicago is 13% in Oak Park, 10% in Cicero, and 11% in Berwyn.

#	Commenter Last Name	Comment / Response (*in italics*)
		Households in areas of the west side of Chicago adjacent to I-290 disproportionately lack access to autos for traveling to work, shopping, or pleasure. The proposed changes to I-290 will do little to address this inequity, since public transportation is only tangentially addressed. It does little good for a household without a car for automobile transportation times and levels of congestion to be slightly reduced. As jobs, retail opportunities and sources for recreation are increasingly found in the suburbs, a more equitable transportation policy would be one that while maintaining auto accessibility would also improve public transportation. Suggested improvements of the CTA Blue Line associated with this project are quite modest and do little to address the inequities.
		It should be noted that the I-290 Study Area already has a very dense transit network, especially east of Austin Boulevard with CTA Bus, CTA Rail (Blue and Green Line), and Metra service. The I-290 Study Area also already has a transit utilization rate of 21% for work trips, which is nearly double the regional average of 12% for transit. *The Preferred Alternative contains transit improvements, including a recommendation for a high capacity transit (CTA Blue Line) extension with the reservation of space for this future CTA Blue Line extension. In the interim, express bus service in the managed lane is accommodated, in addition, access to the existing CTA Blue Line stations would be improved through new bus pull-outs, bus stops relocated to better align with the existing stations, wider sidewalks, improved intersection cross-walks, a new east-west shared use path, bicycle lanes, and ADA improvements.*
296	Peterman	I am aware of the limits of the Draft EIS and of the present priorities of the CTA that do not favor the extension of the Blue Line, but would like to suggest that the immense expenditures to be spent and the significant disruptions associated with the I-290 project that will result in only modest improvements in travel time and congestion, is a poor policy choice. A much more appropriate transportation strategy and one that would address existing environmental inequities for minorities and low-income populations of Chicago's west side would be to shift from road building to improving and extending rail rapid transit (CTA).
	Peterman	*The purpose and need for the I-290 project includes improving safety and transportation facility deficiencies. The I-290 Eisenhower Expressway was designed and built well over 50 years ago and requires reconstruction. The crash rate on I-290 is also higher than other similar expressway sections in the region. The lane drop (change from four lanes to three lanes) and left hand ramps also contribute to worse crash rates than comparable sections. The Preferred Alternative includes the reconstruction of I-290 and improved safety by providing four continuous lanes in each direction and removal of the left hand ramps. The purpose and need also includes improving regional and local travel and access to jobs. In the Preferred Alternative , the HOT 3+ lanes would provide travel time savings of up to 56% and the general purpose lanes would experience up to 25% time savings based on 2040 projections and additional access to nearly 400,000 regional jobs. The DEIS documents that there are no disproportionate impacts to low income or minority communities. In addition, many aspects of the Preferred Alternative would be beneficial to individuals that do not own a car, including: congestion relief on nearby arterials and the I-290 corridor (which would improve the performance of buses), improved transit connections at CTA stations, improved bike and pedestrian accommodations (including a 2 mile extension of the Prairie Path), and the encouragement of carpooling (the HOT lane would allow carpoolers to ride toll free, and would benefit from a 56% reduction in travel time). The median of I-290 is also designed to be convertible to accommodate a High Capacity Transit (HCT) extension from Forest Park to Mannheim Road in the future, which could be a Blue Line rapid transit service extension.*
297	Rankin	I'm a homeowner in Oak Park near Austin Boulevard. I don't have a driver's license. To get around, I use my senior citizen $50 pass and use the Blue Line all the time. I just have several comments that I would like to just put on the record, and I will fill out the forms as well. But I did have a couple ideas that I liked a lot of what I saw. I'm delighted with the redesign of the Austin station, which I use personally every day more than once. My first kind of question/comment is the one thing that disappoints me the most is there is no rail extension of the Blue Line past the Forest Park station stop. And my comment is that I see the CTA is doing some wonderful things downtown with the new bus stops. In fact, they are designing bus stops that almost look like stations. So rather than just reserve a

#	Commenter Last Name	Comment / Response (*in italics*)
		corridor or some grass for a future, future Blue Line extension, why not build a real bus route where people would get off the Blue Line at the Forest Park station stop, and transfer to an express bus that would simulate what a train could be in the future. And this shouldn't just stop where the current right-of-way is indicated, but there is no reason why it couldn't curve up to O'Hare or curve down to the south side as well so it could create kind of a beltway or a loop around Chicago. The thing that fascinated me most, I heard the comment that the original Eisenhower was multimodal and was the first of a kind, a real innovation. So we should try to innovate, too. So this idea of a rail, of a bus, an express bus extension, simulating, would be a real innovation.
		The preferred alternative includes accommodations for an express bus coming from the Forest Park station going west and the bus would ride in the managed lane. The managed lane is structured so that there would be a 45 mph minimum operating speed. It would act like an express, and extend beyond the Study Area. *CTA: The question of a CTA rail line extension has come up several times during this project. The CTA had limited funds in the Vision Study. The most important aspect for the CTA is to maintain the existing infrastructure. It would be irresponsible to seek federal funds for an extension without maintaining the existing facilities; similar to having a house and your roof is leaking, it's not a good time to put on an extension. The focus of this study first was to look at the existing infrastructure. And once CTA can get that under control, we will continue to look at opportunities system-wide where there may be opportunities for extension.*
298	Rankin	1) New INFILL station in Oak Park - The CTA should research the value of creating an additional Blue Line station for Ridgeland Ave (6400 west) More and more young residents of Oak Park are traveling to UIC, med center, downtown Chi etc. for work and study. This new station could "hug" Ridgeland - otherwise it could also run from Ridgeland to East - and the existing Oak Park station might run WEST from OP Ave. instead of east?
		In the CTA's Blue Line Vision Study, the need for a new station at Ridgeland Avenue was not identified. Spacing of stations is done to promote ridership and to maintain average travel speeds.
299	Rankin	2) UNNECESSARY DELAYS- Blue Line trains are often delayed because they must wait for signal clearance or an available track in Forest Park station. The Green line has the same problem as an end point on that line - trains sit and can't discharge passengers at Harlem. The delays can be VERY lengthy - just they are at O'Hare sometimes. Because of these delays Blue Line rider miss bus connections at Forest Park.
		This is a CTA operational matter that has been forwarded to CTA staff.
300	Rankin	3) "RAPID BUS" / INNOVATIVE MULTIMODAL DESIGN / METRO CHICAGO PUBLIC TRANSIT BELTWAY + CORRIDOR - Cities like Atlanta are realizing the high value of new bus "corridors" CTA should build a series of "stations" for its express bus service running west from Forest Park complex and this service should fan out in multiple directions (like Green line in Boston), including all the way to O'Hare. The new "stations" could resemble downtown LINK raised platform design. IMPORTANT - people disembarking the Blue line train at FP must be able to effortlessly and quickly walk across the platform and board an express bus. (they should not even have to go upstairs) Express bus schedules would dovetail with Blue Line train schedules. An incoming "bus" is greeted by a waiting train.The bus stops should resemble train platforms. This encourages future businesses to begin to grow up around and "hug" the new bus corridor emerge hugging the improved express bus service to a strange of important suburbs west of Forest Park - This transit corridor will simulate what a rail line might someday look like.
		Generally, Pace would operate express bus service heading west from the Forest Park station. Pace is beginning to implement a rapid transit bus network comprised of arterial bus rapid transit and suburban expressway service.
301	Rankin	4) MAKE EISENHOWER AN ECONOMIC CORRIDOR The biggest single problem with this design IMHO is its failure to encourage commercial/business development near many of the station entrances. The dead areas around the Austin Blvd entrance are a good

#	Commenter Last Name	Comment / Response (*in italics*)
		example - an excellent solution would be to build a mid-sized multistory hotel and parking structure to replace the Village parking lot now just north of expy across from Columbus park Proposals should be solicited from developers. Space should be reserved on ground floor of the new hotel for various types of businesses such as small grocery stores/supermarket. Make room for a neighborhood Walmart for example Another idea - build a small movie theater complex at Harlem near the expressway - again that whole area is DEAD and unwelcoming and urgently needs to be transformed in a catalyst for economic growth and jobs.
		IDOT does not control or regulate land development such as described in your comment. Such a development would come under the purview of the Village of Oak Park, and they would need to initiate any discussions of redesign of the I-290 features with IDOT to accommodate it, if any entrances, drainage structures or other items were within the project limits.
302	Rankin	5) REVOLUTIONARY IMPACT OF MOBILE PHONES ON PUBLIC TRANSIT Uber cars and Uber competitors are already picking up and discharging passengers at Austin Blvd station entrance. Design should be friendly to such services There should be areas near many of the stations for ad hoc staging of car pools by drivers - and for Uber and other services - and some of these new services will doubtless in several years include driverless for hire vehicles by individuals or small groups.
		The increased use of for-hire transportation services such as Uber will likely change automobile usage patterns; however, these changes are difficult to forecast as this type of service is an emerging technology. One of the challenges of providing additional pick-up and drop-off space near CTA rapid transit stations is the limited amount of curb area available and the need to also maintain space for bus transit vehicle pick-up and drop-off.
303	Rankin	6) BUSES OF THE FUTURE CTA city and Pace bus will likely be driverless by the time new expway is finished - and likely downsized for more frequent flexible service. We need lots of places all along the length of the redesigned expressway for this new fleet of buses to pick up and discharge riders.
		The implementation time frame for driverless buses nationally and locally is unclear. The I-290 Preferred Alternative includes a high occupancy toll (HOT) lane where carpools with three or more occupants and transit buses would travel for free. Transit buses would pick-up passengers on the arterial street portion of their route and then enter I-290 and enter the HOT lane. The HOT lane in the Preferred Alternative is projected to have a 56% travel time improvement over the No Build Alternative.
304	Rankin	7) TRAINS OF THE FUTURE Have shorter Blue line trains (fewer cars) but more frequent Trains. METRA is a good example of problem - trains running with many empty seats - short the trains but add MANY additional trains to the schedule.
		CTA, Metra, and Pace continuously try to balance passenger demand and service levels system-wide, with an emphasis on higher utilized routes.
305	Rankin	8) Instead of having just 4 lanes on expressway (one lane with toll) - would there be room for 5 lanes in both directions??
		There is insufficient space to add additional lanes beyond the HOT 3+ lanes (such as 5 lanes in each direction) without major impacts to existing homes and businesses; one of the project goals is to minimize impacts to the surrounding environment, including building displacements.
306	Rankin	9) LEVERAGE VALUE OF TODAY"S BLUE LINE Effective immediately the Austin 91 bus should be extended to Cermak - it makes no sense to terminate service at Roosevelt - a slightly longer route will act as a feeder from the south for increased ridership to Blue Line. We need to maximize the existing Blue Line infrastructure.
		Thank you for your comment. Your comment has been forwarded to the CTA.
307	Rankin	10) SPIFF UP WHAT WE HAVE NOW - Effectively immediately a simple low cost ongoing program should be instituted to better maintain greenway on sides of expressway - garbage has been accumulating for many years - grass is all weeds - never cut.

#	Commenter Last Name	Comment / Response (*in italics*)
		IDOT performs litter pickup and mowing activities on a periodic basis. Community-based initiatives can increase the frequency of these activities with IDOT permission.
308	Rankin	11) DONT MAKE STATIONS ON WESTERN END OF BLUE LINE INFERIOR TO STATIONS CLOSER TO DOWNTOWN The design of the Austin station should resemble the new Halsted station - riders should leave the station entrance and be able to walk across Austin to catch a northbound station. Consider having canopy over this area to protect riders.
		The Blue Line Vision study includes station improvements as one of its objectives. A conceptual rendering of the Austin station shown at the Blue Line Vision Study's January 25 and 26, 2017 Public Meetings (held in concurrence with the I-290 Public Hearings) included improvements such as ADA accessibility, landscaping, pedestrian crossings/refuges, station entrance design, bike racks, lighting, improved maintenance and constructability, wider platforms, and shelter/weather protection.
309	Rankin	12) EFFECTIVELY IMMEDIATELY Seamlessly integrate PACE and CTA bus networks - avoid dead ends and overlap of services. Having two networks is EXTREMELY wasteful - and bus service can be revolutionized for very little capital expenditure
		Thank you for your comment. Your comment has been forwarded to the transit agencies.
310	Raphael	I am concerned about the impact of construction on my home that is close to the Eisenhower. I am requesting that homeowner concerns are taken into consideration on the potential impact to my foundation. I am also concerned about the noise from the project, the noise from helicopters and I am wondering if there are ways to limit the news helicopters.
		In Phase II (final design) IDOT will work with the local communities and other stakeholders to develop and implement strategies to minimize/mitigate construction effects. This will include development of specifications to address noise, dust, time of work, and materials storage within the context of the community. Also, IDOT will coordinate with the communities to develop a scope of work for an overall monitoring program to address vibration/settlement concerns. However, the execution of the program, beginning with condition surveys of buildings, would not be initiated until closer to the time of construction.
311	Raphael	I am also concerned about the increased air pollution due to the increased number of cars.
		The Preferred Alternative shows slight improvements in pollutant emissions, greenhouse gas emissions, and mobile source air toxics, as compared to the No Build Alternative, as described in Section 3.3 of the FEIS.
312	Raphael	I also would like IDOT to increase the size of the East Ave. bridge.
		Section 3.1.8.2 of the FEIS provides more information on the proposed improvements to East Avenue. Existing sidewalks that are between 5 and 6 feet wide will be improved to 12 feet wide along the east side and 16-feet wide along west side where the Blue Line CTA station entrance is located and can be configured to accommodate a DIVVY bike rack near the CTA station entrance. Pedestrian plaza areas will be provided at each corner of the bridge to improve visibility and provide more space for pedestrian Activities. Connections to the east-west shared use trail, high visibility crosswalks and improved lighting are also proposed.
313	Raphael	I am wondering where the staging of materials will be and hope it is on the expressway itself instead of in the neighborhoods.
		Currently, the I-290 project is in the planning stage. Materials storage is considered during subsequent final design and construction project development phases. Typically, contractors can store materials and equipment on the I-290 right-of-way as far as is practical. If they need additional space to store materials and equipment, they must obtain permission from private or public property owners, and abide by any local regulations pertaining to construction activity and storage.
314	Reed	The 3+ lanes will NEVER work. What is needed is a dedicated express lane(s) with limited access and definite barriers separating local and express lanes - who will enforce?

#	Commenter Last Name	Comment / Response (*in italics*)
		High occupancy toll (HOT) lanes are in operation across the country. Enforcement for the I-290 HOT 3+ lane and other operational features will be developed during Phase II (final design)
315	Reed	Access lanes from Harlem to Eisenhower too short, causing congestion on Harlem, both N. bound and S. bound.
		As part of the Preferred Alternative, full reconstruction of Harlem Avenue is proposed, including substantial improvements for both pedestrians and vehicles. Traffic operations at the interchange will be improved through geometric and turning path improvements, better demarcation between pedestrian and vehicular traffic, and accommodating dual left turn lanes from the I-290 ramps. The ramps will be lengthened and moved to the right. The proposed design will address congestion on northbound and southbound Harlem Avenue, and more efficiently accommodate all movements at this interchange. The design of the I-290 exit ramps results in the ability to store more vehicles exiting the expressway on the ramps and the ability to empty the waiting vehicles more quickly. This operational improvement on the ramps will result in the ability to provide longer green signal time for local north-south traffic movements along Harlem Avenue.
316	Reed	The Harlem overpass will not solve the problem of semi trucks entering and exiting the Eisenhower. They consistently snarl traffic on Harlem.
		Harlem Avenue (IL 43) is a state route and a designated Class II truck route; as such, truck traffic cannot be restricted from utilizing Harlem Avenue to enter to, or exit from I-290. However, the proposed improvements are designed to better accommodate large trucks that use this interchange. This includes improved turning radii and coordinated signal timing/phasing that will prevent conflicting opposing turning movements that cause operational problems today.
317	Rhodes	This project is wasting money. The Hillside strangler project helped very little for what it cost. Maywood needs funding for after school programs. We just lost Aldi's, we're losing businesses in Maywood. Half the houses are in or about to be in foreclosure. So many other things need to be funded. I don't know how this project got this far. I have voting no to this project as so have many people I have talked to. This is simply a porkbelly bill, wasting tax dollars!!
		The reconstruction of the Hillside interchange of I-88, I-290 and I-294 was a spot improvement project completed in 2001 that did not add mainline I-290 capacity. However the project addressed a dangerous weaving condition where the East-West Tollway (I-88), ramps from the Tri-State Tollway (I-294) and Roosevelt Road (Illinois 38) all converged into just one lane approaching the Eisenhower Expressway (I-290). Safety and travel times for eastbound traffic from I-88 to I-290 were improved in particular. In general, I-290 is a vital transportation corridor that serves over 200,000 vehicles per and that connects people, communities and employment centers. I-290 experiences thousands of crashes, and the proposed improvement will improve safety, mobility for all users. This facility was originally constructed during the 1950s and is now at the end of its useful service life and is in need of reconstruction based upon its condition alone.
318	Rooks	Currently, the Sight Lines at Lombard Bridge at Garfield and Lombard are obstructed by concrete walls combined with the sharp angle of the bridge merging into Garfield. Drivers make wide turns because of the lack of good Site Lines. The bridge acts as a walk way for Irving Elementary School children from their homes to school; the area is located by a park and community center with children drop off areas; and the Lombard CTA access point is located here. Since the bridge is IDOTs responsibility wrt building and design, the site lines and pedestrian traffic (specifically for small children) needs to be improved. Additionally, a Divvy bike station is located here. Many bicycles cross at this bridge (since Ridgeland is a very busy street). Children ride their bikes over this bridge to their school friends located on the other side of the highway and to baseball and soccer games that occur at Barrie Park. A bike lane should be added to this bridge to assist with cyclist safety. Please note I know individuals who have been hit by cars multiple times at this intersection. It is not currently safe and the design needs to be greatly improved. Please consider adding speed tables or rumble strips prior to pedestrian walk ways to decrease driver speed.

#	Commenter Last Name	Comment / Response (*in italics*)
		In coordination with the Village of Oak Park, several pedestrian improvements are planned for Lombard Avenue. Section 3.1.8.2 of the FEIS provides more information on the proposed improvements to Lombard Avenue. Existing sidewalks that are between 5 and 6 feet wide will be improved to 12-feet wide along the west side and 16-feet wide along east side where the Blue Line CTA station entrance is located, and can be configured to accommodate a DIVVY bike rack near the CTA station entrance. Pedestrian plaza areas will be provided at each corner of the bridge to improve visibility and provide more space for pedestrian Activities. Connections to the east-west shared use trail, high visibility crosswalks and improved lighting are also proposed. Also, lowering of the Lombard Avenue profile will improve sight lines across the expressway by effectively lowering the existing 'hump' of the bridge over I-290 by 1 foot.
319	Sokol – Oak Park Historic Preservation Commission	I am a long-time resident of Oak Park, a former Village Trustee, and a member of the Historic Preservation Commission. I am profoundly concerned about the plan for the Eisenhower Expressway, for the way construction would impact and have an effect on at least two local landmark buildings and perhaps many other structures. Both the Oak Park Conservatory and the Maze Library, the two landmarks, can suffer damage from the vibrations of the construction, in a way similar to the damage to the building at UIC that is next to the north side of the Expressway near the Byrne interchange.
		As discussed with the Oak Park Village Board, construction methods that minimize the potential for noise and vibration impacts as well as monitoring of sensitive structures during construction will be developed in subsequent project phases. IDOT will implement an existing structure monitoring program that will begin prior to construction. Existing conditions of buildings adjacent or near the expressway (identified in coordination with local communities) will be documented prior to any project-related construction activity. The monitoring would be continued for a period after construction to document post construction conditions. IDOT will work with the communities to develop a scope of work for the overall monitoring program during the design phase of this project.
320	Sokol – Oak Park Historic Preservation Commission	I am asking that you consider alternatives of mass transit instead of this massive, disruptive, costly, and potentially damaging construction project.
		Transit alternatives were studied extensively. An extension of the Blue Line to Oak Brook was considered and evaluated in Round 1 of the single mode alternatives evaluation. There is currently a lack of supporting land uses for an extension of the Blue Line (54% of any new ridership generated by a Blue Line extension would be drawn from other existing transit services in the area). The expressway and the CTA Blue Line serve two different travel markets and as such a Blue Line extension would not result in any meaningful congestion relief (See Section 2.3.3.1 of the FEIS). There is currently a robust transit network already in place, with 21% of the work trips using transit in the study area, as compared to 12% in the rest of the region. I-290 is a vital corridor for cars, trucks and buses. I-290 was constructed in the 1950s and many elements are at the end of their usable service life, and need to be reconstructed regardless of the HOT 3+ lane addition and other project elements. Approximately 80% of the cost of the I-290 reconstruction is to replace and modernize the existing pavement and bridges, and approximately 20% to construct the new HOT 3+ lanes and other improvements.
321	Stewart	I would like to propose allowing motorcycles into the HOT lane and consider them carpooling 3+ vehicles. Motorcycles get much higher mpg than vehicles and help minimize congestion. If more cars are switched to motorcycles the congestion would decrease.
		The final tolling arrangements and access permissions will be determined in later phases of the project.
322	Suchomel	With adding a lane in both directions, what have you done around the concept of induced demand and how long do you think this is going to be before the latest starts to slip down again in the future?
		IDOT did analyze induced demand by developing build and no-build forecasts. The key issue on an urban project like I-290 is that there isn't urban sprawl. It's already urban. What we would expect to see is redevelopment of existing land uses. There are not a lot of generators of new trips. Based on the analysis, there would be about a 10 percent increase in traffic between, on average, the build and no build volumes due to regional trips shifting from arterials to I-290.

#	Commenter Last Name	Comment / Response (*in italics*)
323	Suchomel	And why is the HOT toll lane better than a free lane in your estimation?
		The HOT lane provided the best balance of arterial relief and improved mobility on the Eisenhower Expressway. The difference between the HOT lane alternative and the general purpose lane alternative is that with a general purpose lane alternative, we would not be able to provide enough additional lanes that predictable, reliable trip. With a managed lane and structuring the toll rates, we would have a 45 mph trip on that inside lane.
324	Tammen	Infrastructure improvements are greatly needed on this corridor. The interchanges are greatly outdated and unsafe. Additionally, the whole area is an eyesore and needs more greenspace, landscaping, etc.
		Thank you for your comment.
325	Tammen	Obviously, the State of Illinois needs to examine alternative funding measures for transportation. Tolling and gas taxes are the perfect mechanism as they are essentially applying a "user fee". IDOT and the State Legislature need to examine and pass legislation that would allow use of Public/Private Partnerships, use of Design/Build construction and allow for the tolling of the interstate system. These mechanisms are already working well in other states and with Illinois' fiscal issues that state needs to be pro-active and not reactive to those alternative funding solutions.
		Thank you for your comment. Funding and financing will be analyzed further in the next phase of project development.
326	Thomas	Last time you were here, you stated there was a question regarding the wall that would go along Harrison Street. Do you have any results on that? And then also, too, I understand in your brochure you state that Phase II and beyond is not funded. We have a new administration in Washington. What are the chances of it getting funded?
		The chances of getting additional funding are not known at this time. IDOT will develop a financial plan and look at various funding mechanisms. If there is a new transportation program in Washington, IDOT will investigate how the Eisenhower project would fit with that program.
327	Thomas	So that would be after the summer, after the Phase I studies currently taking place in 2017, you would go to Washington to try to get the appropriations?
		IDOT would start off with performing a financial analysis. IDOT will also be observing what transpires at the federal level because there is currently an outline of a plan and conversations about transportation funding. However, until the Eisenhower Expressway project is put together in a specific program, the details of how the Eisenhower fits with that potential future funding is not known.
328	Vanek	Encouraging the expansion of automobile traffic in the 21st century without expanding, enhancing and promoting public transportation is to be on the completely wrong side of history. Younger people are eschewing automobile ownership more and more as well they should be. In many years of observation while riding the Blue Line from Oak Park to downtown, there are very few cars with two commuters let alone three.
		Annual vehicle miles traveled is at an all-time high, with younger generations increasing their share of new vehicle purchases. Transit was also extensively evaluated as part of this study and many transit improvements are included as part of the Preferred Alternative. There is a robust existing transit network that accommodates 21 percent of work trips in this corridor versus 12 percent regionally. Stand-alone transit improvements, such as the extension of the Blue Line, did not result in any travel performance improvement to the I-290 Expressway (see Section 2.3.3.1 of the FEIS). In addition, 54% of the new ridership on a Blue Line extension would come from existing transit services. This indicates a lack of supportive land use for a heavy rail transit extension, however a corridor is preserved for a future extension of the Blue Line to Mannheim Road in the median of I-290. Initially, express bus service will operate in the managed lanes. The managed lanes will also provide a reliable toll free trip option for high occupant vehicles, which will encourage carpooling.

#	Commenter Last Name	Comment / Response (*in italics*)
329	Vanek	Not only that but no one at the last meeting had ANY idea how enforcing the three-person rule was going to be done.
		Operation and enforcement aspects of the I-290 managed lane will be developed and discussed with stakeholders during Phase II (final design).
330	Voyles	Please, please, please, please, please do NOT put up sound walls through Oak Park! We already have sound barriers because the expressway is several feet below the surface! Transient apartment dwellers who do not own residential property, but are closest to the expressway, should NOT have been the people given the vote. Thank you!!
		The FHWA traffic noise regulations (23 Part 772) and the IDOT traffic noise policy ask all receptors benefited by a proposed noise wall to vote for or against its construction, regardless of ownership status. Some renters are short-term occupants, but others reside at the rental property longer than some homeowners, and restricting voting to only property owners could be viewed as discriminatory, and could also be an environmental justice concern.
331	Williams	*How will some of the local communities be impacted financially with some of these changes that improve everything else? Other than federal dollars, where will the other money that you need come from?*
		Traditionally, interstate highway reconstruction is eligible for 80 to 90 percent federal funding. There are potential local costs depending on the scope of work in each community. For example, 80 percent of the cost of installing traffic signals is funded by the state or federal government, and the other 20 percent of cost is divided between the municipalities and/or the state, depending on which agency has jurisdiction over the roadway legs of the intersection. *In the next phase of the project, IDOT will work with each municipality to develop a Letter of Intent that spells out the scope of work items, as well as the local cost for participation for each item. IDOT will also be developing a financial plan to capture the overall funding responsibility. By the end of this planning process, more will be known about specific local cost participation, but more work will be needed to identify the financing for the overall project.*
332	Witt	No more tolls! Not working with the Elgin/O'Hare! Too expensive and traffic isn't cooperative. The state so corrupt, tolls just take more $ and no wonder there are so many fleeing the state! Stop the tolls!
		Given the level of congestion and limited space for expansion, the addition of a managed lane emerged as the Preferred Alternative. The I-290 Preferred Alternative provides additional capacity, improved operations, and a reliable trip while avoiding community impacts. Specifically, the Preferred Alternative includes three general purpose (no tolls) lanes in each direction (25% travel time improvement versus the No Build Alternative), and a HOT 3+ lane (variable toll depending on traffic congestion) in each direction. Vehicles having 3+ occupants and transit buses traveling for free (56% travel time improvement versus the No Build Alternative), so users of I-290 would have a choice.

Re: I-290 (Eisenhower Expressway) from West Mannheim Road to Racine Avenue, Chicago, Cook County, Illinois.

Dear Mr. Harmet,

Pursuant to consultation under Section 106 of the National Historic Preservation Act (1966 as amended) the Forest County Potawatomi as a Federally Recognized Native American Tribe reserves the right to comment on Federal undertakings, as defined under the act. Thank you for your participation in the process.

This response is related to the project described above. I have reviewed the Draft-EIS submitted for comment by Illinois DOT. While the document seems very comprehensive in relation to historic properties related to architecture I have some questions regarding the archaeological component of the study. It is clearly stated that there are no known archaeological sites within the project APE, but it is unclear what was done. What sort of identification effort was made, was there an archaeological study, or just an archival review? A letter from Brad Koldehoff to Dr. Rachel Leibowitz dated May 27, 2016 states there has been and archaeological clearance under a letter from August 13, 2015, but the letter was not included in Appendix E-4. If there was an archaeological identification survey the Tribal Historic Preservation Office on behalf of the Forest County Potawatomi Community requests a copy of the report, an electronic copy is fine or access to it online if available. 1

Your interest in protecting Illinois' cultural and historic properties is appreciated. If you have any questions or concerns, please contact me at the email or number listed below.

Respectfully,

Michael LaRonge
Tribal Historic Preservation Officer

CS#3470

Based on the information submitted, it appears that any of the alternatives (except the no build) will impact waters of the U.S. but that the permanent impacts will be below 1 acre. In that case, the applicant will need to submit a permit application to the Army Corps of Engineers Chicago District to obtain a Section 404 permit. At this time, it is anticipated that the project will be reviewed under Regional Permit 3. The project should be designed to comply with this permits conditions. The wetland delineation will need to be updated prior to submitting an application.

Philadelphia, Pennsylvania 19106-2904

IN REPLY REFER TO:

February 9, 2017

9043.1
ER 16/0731

Catherine A. Batey
Division Administrator, Illinois
Federal Highway Administration
U.S. Department of Transportation
3250 Executive Park Drive
Springfield, Illinois 62703

Dear Ms. Batey:

The Department of the Interior (Department) has reviewed the Section 4(f) Evaluation for the Draft Environmental Impact Statement (DEIS) for the I-290 Eisenhower Expressway in Cook County, Illinois. The Department offers the following comments and recommendations for your consideration.

Section 4(f) Comments

The Illinois Department of Transportation (IDOT), Federal Highway Administration (FHWA), Federal Railroad Administration, and Federal Transit Administration propose improvements to the I-290 Eisenhower Expressway multi-modal corridor. The project location is a 13-mile long corridor along the existing I-290 corridor from Mannheim Road to Racine Avenue. Five purpose and need points were identified for improving transportation along this facility: 1) mobility for regional and local travel; 2) access to employment; 3) safety; 4) modal connections and opportunities; and 5) transportation facility deficiencies. The DEIS considers four build alternatives, along with a no-build alternative.

The DEIS identified several properties in the project study area eligible to be considered under Section 4(f) of the Department of Transportation Act of 1966 (48 U.S.C. 1653(f)). The DEIS states:

> No Section 4(f) use of historic properties, parks, wildlife/waterfowl refuges, recreation areas except for 0.031 acres of direct use and 0.137 acres of temporary use to parks maintained by Park District of Forest Park; Veterans Park, the Dog

Park and the Recreational Center (Roos property). The areas are proposed by the Village to accommodate widened sidewalks and provide for access to the shared-use path proposed to from the Illinois Prairie Path to Central Avenue. Based on informal consultation with the Village, a de minimis impact under Section 4(f) is proposed. Formal written concurrence will be required by the Village.

Consultation with the Chicago Park District has been initiated regarding the extension of the proposed shared-use path through Columbus Park, along with the placement of small berms and trees. October 15, 2015 correspondence from the Chicago Park District indicated no adverse impact and a potential enhancement for the park. In addition, informal consultation with the State Historic Preservation Officer (SHPO) and Illinois Historic Preservation Administration (IHPA) indicated that these improvements, as a national historic landmark, would not result in an adverse effect finding. It is intended that this would be processed by FHWA as a temporary occupancy, avoiding any Section 4(f) use of Columbus Park. Formal written concurrence will be required by the Chicago Park District and SHPO/IHPA.

The summary notes that, in addition to Columbus Park, five properties listed on the National Register of Historic Places (NRHP), and one historic district pending NRHP designation, are within the area of potential effects. The Department assumes that consultation with the SHPO and IHPA will include discussion of those properties as well. 1

The DEIS did not identify any properties in the project study area to be considered under Section 6(f) of the Land and Water Conservation Fund (LWCF) Act of 1965 (54 U.S.C. 200305(f)(3) et seq.) or the Urban Park and Recreation Recovery (UPARR) Act of 1978. The Department has determined that Forest Park and Garfield Park are within the area of potential effects and are encumbered under LWCF, and that Columbus Park is encumbered under UPARR. The proposed project constitutes a use that will partially convert these recreational resources. 2

The LWCF Act states “No property acquired or developed with assistance under this section shall, without the approval of the Secretary, be converted to other than public outdoor recreation uses. The Secretary shall approve such conversion only if he finds it to be in accord with the then existing comprehensive statewide outdoor recreation plan and only upon such conditions as he deems necessary to assure the substitution of other recreation properties of at least equal fair market value and of reasonably equivalent usefulness and location.”

The UPARR Act states “No property improved or developed with UPARR assistance shall, without the approval of NPS, be converted to other than public recreation uses. A conversion will only be approved if it is found to be in accord with the current local park and recreation Recovery Act Program and/or equivalent recreation plan and only upon such condition as deems necessary to assure the provision of adequate recreation properties and opportunities of reasonably equivalent location and usefulness. Section 1010 is designed to ensure that areas or facilities receiving UPARR grant assistance are continually maintained in recreation use and available to the general public.”

Impacts to and conversions of LWCF- and UPARR-encumbered properties require coordination with the State of Illinois Department of Natural Resources, the Village of Forest Park, the City of Chicago, and the National Park Service. The DEIS notes that efforts were made to avoid impacts to 4(f) resources and to find ways to reduce the severity of the impacts in consultation with the Illinois State Historic Preservation Officer (SHPO) and other consulting parties. The Department withholds its concurrence that all possible planning was done to minimize harm to 4(f) resources until SHPO concurrence is received and impacts to LWCF- and UPARR-encumbered properties is resolved. 3

The Department has a continuing interest in working with the FHWA and other agencies to ensure impacts to resources of concern to the Department are adequately addressed. For issues concerning section 4(f) resources, please contact Regional Environmental Coordinator Scott Blackburn, Midwest Regional Office, National Park Service, 601 Riverfront Drive, Omaha, Nebraska 68102, telephone (402) 661-1844.

We appreciate the opportunity to provide these comments.

Sincerely,

Lindy Nelson
Regional Environmental Officer

Re: Draft Environmental Impact Statement for the Interstate 290 (I-290) Eisenhower Expressway, Cook County, Illinois – CEQ #20160315

Dear Mr. Peterson:

The U.S. Environmental Protection Agency has reviewed the Draft Environmental Impact Statement (EIS) for the Interstate 290 (I-290) Eisenhower Expressway prepared by the Federal Highway Administration (FHWA) and the Illinois Department of Transportation (IDOT). Our comments are provided pursuant to the National Environmental Policy Act (NEPA), the Council on Environmental Quality's NEPA Implementing Regulations (1500-1508), and Section 309 of the Clean Air Act.

IDOT/FHWA propose a series of improvements to I-290 and auxiliary roads to improve regional and local travel, access to employment, safety, modal connections and opportunities, and facility deficiencies. The project extends from west of Mannheim Road to Racine Avenue in Cook County, Illinois. Potential impacts are primarily to the human environment, as the corridor is largely in an urban, developed area.

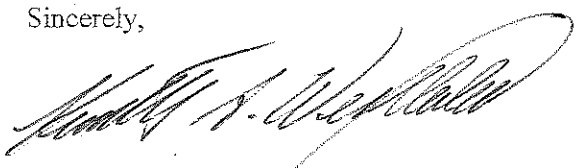
Four alternatives were carried forward for consideration in the Draft EIS, in addition to the no build alternative. The four build alternatives are:

- *General Purpose/Express Bus/High Capacity Transit* ("General Purpose Alternative"): Add one general purpose lane (lane without restriction of number of occupants or imposition of a toll) in each direction between 25th Avenue and Austin Boulevard, and include provisions for Express Bus and High Capacity Transit.
- *High Occupancy Vehicle/Express Bus/High Capacity Transit* ("HOV 2+ Alternative"): Add one High Occupancy Vehicle (HOV) 2+ (two or more occupants required for use) lane in each direction between 25th Avenue and Austin Boulevard, convert one existing general purpose lane in each direction west of 25th Avenue and east of Austin Boulevard to HOV 2+ use, and allow for Express Bus and High Capacity Transit.
- *High Occupancy Toll/Express Bus/High Capacity Transit* ("HOT 3+ Alternative"): Add one High Occupancy Toll (HOT) 3+ (three or more occupants per vehicles required for non-toll use) lane in each direction between 25th Avenue and Austin Boulevard, convert one existing general purpose lane in each direction west of 25th Avenue and east of Austin Boulevard to HOT 3+ use, and allow for Express Bus and High Capacity Transit.
- *High Occupancy Toll/Toll/Express Bus/High Occupancy Transit* ("HOT 3+/Toll Alternative"): Add HOT 3+ lane in each direction between 25th Street and Austin Boulevard, convert one

Recycled/Recyclable • Printed with Vegetable Oil Based Inks on 100% Recycled Paper (100% Post-Consumer)

existing general purpose lane in each direction west of 25th Avenue and east of Austin Boulevard to HOT 3+, convert remaining general purpose lanes to toll (all users paying tolls), and allow for Express Bus and High Capacity Transit.

The proposed footprint and interchanges are the same for all build alternatives and include:



- Reconstruction of 25th and 1st Avenue interchanges as Single-Point Urban Interchanges (SPUI).
- Reconstruction of Harlem Avenue and Austin Boulevard, which currently have left-hand ramps, to a modified SPUI interchange with right-hand ramps that retains a center interchange where the ramps converge with cross-streets.
- Braided ramp design between Austin Boulevard and Central Avenue interchanges
- Reconfiguration of ramps between Laramie Avenue and Cicero Avenue to remove substandard mainline weaving and adding frontage road U-turns to improve local traffic.

The preferred alternative is the HOT 3+ Alternative; because IDOT/FHWA has identified a preferred alternative in the Draft EIS and pending no new, significant information or substantial changes, IDOT/FHWA expect to release a combined Final EIS-Record of Decision (ROD), per Section 1319(b) of the Moving Ahead for Progress in the 21st Century Act (MAP-21).

Based on our review of the Draft EIS and participation in agency and public meetings, EPA rates the Draft EIS as **EC-2, Environmental Concerns – Insufficient Information**. This is primarily based on potential human health and environmental impacts to susceptible populations as a result of construction and related mitigation measures. We have also identified several clarifications regarding methodology. Finally, EPA commends several features of this project. Detailed comments and a summary of our ratings definitions are enclosed.

Thank you in advance for your consideration of our comments. We look forward to reviewing the Final EIS and ROD. If you have any questions or concerns, please feel free to contact me or Elizabeth Poole of my staff at (312) 353-2087 or poole.elizabeth@epa.gov.

Sincerely,

Kenneth A. Westlake

U.S. EPA – Detailed Comments on the
Draft Environmental Impact Statement for the
Interstate 290 (I-290) Eisenhower Expressway, Cook County, Illinois

Social/Economic Characteristics

Methodology

The socio-economic analysis appears to rely on demographic information for the entire City of Chicago to represent populations impacted by the corridor. We note use of both "Chicago" and "Chicago (within I-290 Study Area)" in discussions, tables, and figures throughout Section 3.1. Use of the entire City of Chicago is not an appropriate or meaningful geographic unit of analysis because actual, corridor-adjacent conditions are masked by city-wide demographics. For instance, in the discussion on page 3-8 regarding age, the Draft Environmental Impact Statement (EIS) states that four communities along the corridor have higher percentages of young children (under the age of 18) compared to the reference population of Cook County. The methodology[1] should use the more appropriate and reflective "Chicago (within I-290 Study Area)". Thus, this section should state there are five communities, including "Chicago (within the I-290 Study Area)", which exceeds the reference population for children, at 24.8%. For context, EPA finds the discussion and data table regarding *Auto Ownership* to be most meaningful. 1

> **Recommendation**: We recommend the Final EIS include discussions and data that are clearer and more representative of the potentially impacted communities within the city limits of Chicago. IDOT/FHWA should consider removing data related to the entire city (for comparison purposes) and rely on data that represents Chicago within the I-290 Study Area. If IDOT/FHWA continue to include the entire city of Chicago dataset, EPA recommends clarifying why this information is the more appropriate geographic unit of analysis.

EPA notes the city of Cicero is included in the analysis but the city of Berwyn is not. The Draft EIS states that communities "that are either partially or wholly within the Project Corridor are listed." The city limits of Cicero do not appear to intersect with the Project Corridor. The city limits of Berwyn (immediately west of Cicero) appear to be similarly situated from I-290 as the city limits of Cicero, but does not appear to be included in the analysis. 2

> **Recommendation:** EPA recommends the Final EIS clarify why Berwyn was not included in the analysis, when it appears to have the similar adjacency to the project corridor as Cicero.

Environmental Justice

The Draft EIS provided case studies and other data to demonstrate that the tolling aspect of the preferred alternatives will not result in a disproportionately high and adverse impact to low-income and minority populations impacted by the project. The analysis also mentioned several potential remedial strategies, such as increased promotion of car- or van-pooling or toll subsidy programs for low-income households, 3

[1] This methodology also appears to apply to the following demographics, with sites included in parenthesis. Please note this list may not be inclusive: Black/African American (Table 3.4), Asian (Table 3.4), and Housing Characteristics (Table 3.7). The following sets of demographic information appear to be missing the "Chicago (within Project Corridor) information, which would greatly increase the helpfulness of the chart, table, or discussion: I-290 Median Household Income for Project Corridor Communities, 2011 (Figure 3-2), Poverty Levels for Project Corridor Communities, 2011 (Figure 3-3), Project Corridor Community Unemployment Percentages 2000-2014 (Table 3-6) and Travel Time to Work Characteristics of Project Corridor Communities (Table 3-9).

implemented in other communities across the country. The analysis did not specify whether the project team would consider implementation of similar programs, nor whether the unique economic situations of low-income households might impact the success of those programs (for instance, low-income households may not have bank accounts to link to toll transponders to receive discounted or subsidized fares).

> **Recommendation:** EPA is aware that exact tolling mechanisms have not been identified. However, we recommend the Final EIS clarify whether IDOT/FHWA will consider mitigation measures to ensure low-income users of the road have equitable opportunity to use the HOT 3+ lane; this may or may not include the above-referenced toll subsidies discussed in the Draft EIS for other areas of the country. If appropriate, we recommend committing to any toll mitigation in the Record of Decision (ROD). 3

Children's Health

The Draft EIS did not include language regarding the particular vulnerabilities children may face from adverse impacts to air quality during construction activities (Section 3.14.3, *Construction Impacts, Air Quality*). We note the inclusion of general construction-related best practices to reduce emissions. However, EPA has identified additional measures to further reduce impacts to potentially susceptible populations within the project corridor.

> **Recommendation:** EPA recommends that Section 3.14.3 (*Construction Impacts, Air Quality*) be updated to speak to the particular vulnerabilities of children's health when exposed to increased construction-related emissions. We also recommend the following mitigation measures to further reduce potential adverse impacts to children (see below for additional specific construction emissions reduction measures under *Air Quality*): 4
>
> - EPA recommends considering the use of the Air Quality Flag Program[2] during construction to communicate with local communities, particularly with schools and childcare centers, about potential changes in air quality and allow, among other things, for schools or other organizations to adjust their planned outdoor activities. The Air Quality Flag Program reflects regional-scale air quality on a given day and provides baseline conditions that might be exacerbated by construction activity.
> - In order to limit exposure to construction-related emissions, EPA recommends considering limiting construction timing to outside of school and childcare operating hours, where construction is planned adjacent to schools and childcare centers.

EPA previously expressed concern about potential construction-related air impacts, including lead releases as a result of bridge and other infrastructure demolition. We note the discussion of "normal lead based paint" in Section 3.11.1.1, including the definition of *de minimis* conditions, but the Draft EIS does not indicate whether lead testing has been conducted or verified on bridges proposed for demolition, nor consideration of potential mitigation measures to reduce lead exposure to children within the corridor. 5

> **Recommendations:** EPA recommends the following information regarding construction-related air emissions, including lead, be included in the Final EIS; mitigation should be committed to in the ROD, as appropriate.

[2] https://www.airnow.gov/index.cfm?action=flag_program.index

- The Final EIS should clarify the extent to which IDOT/FHWA have considered potential lead releases (from paint chips or dust) during bridge and infrastructure demolition, including whether lead testing has been conducted. If lead testing indicates the likelihood of releases, we recommend the use of contractors that are trained and certified to conduct lead-abatement activities and that they apply appropriate lead-safe work practices. Specific mitigation measures might include containment, end-of-workday cleanup and proper storage of debris and waste, the placement of barriers to prevent lead dust from leaving from the site, the use of personal protective equipment by workers, protocols for entering and exiting the work area and the posting of warnings signs. All other relevant or applicable federal environmental regulations should apply, including the Occupational and Safety Hazard Administrations' lead in construction standards.
- If lead testing indicates there will likely be releases, we recommend targeted outreach to schools and childcare centers within the project corridor to limit exposure to children. We also recommend working with the Chicago and Cook County Departments of Public Health to guide the outreach efforts. Outreach materials might focus on limiting outdoor play and/or open windows during posted construction times. EPA also recommends the following to minimize exposure to lead: washing hands before eating and after coming in from outside, keeping "outside" shoes outside of the school/childcare center, and wet-washing floors, window sills, and window wells every day.

5

EPA notes Traffic Noise (Section 3.4) addresses impacts to most sensitive land uses (residences, schools, parks, and places of worship) but Construction Noise (Section 3.14.4) does not include an assessment of noise to sensitive receptors. Speech interference in schools should be considered when determining disproportionate impacts from construction activities. Children's ability to learn in school is very important to their development and future success. Studies have shown that classroom noise lowers performance on standardized tests[3] and academic achievement has a well-documented effect on health.

6

Recommendations: EPA recommends that Section 3.14.4 (Construction Noise and Vibration) be updated to specifically address impacts to children in the learning environment, as directed by Executive Order 13045 *Protection of Children from Environmental Health Risks and Safety Risks*. Potential mitigation measures may include limiting construction to outside of school and childcare operation hours, which would also reduce potential impacts to children from construction-related air emissions (as discussed above).

Air Quality

EPA recognizes that the project area is in attainment for all National Ambient Air Quality Standards (NAAQS), except for ozone. However, diesel emissions and fugitive dust from project construction may pose environmental and human health risks and should be minimized. In 2002, EPA classified diesel emissions as a likely human carcinogen, and in 2012 the International Agency for Research on Cancer concluded that diesel exhaust is carcinogenic to humans. Acute exposures can lead to other health problems, such as eye and nose irritation, headaches, nausea, asthma, and other respiratory system issues. Longer term exposure may worsen heart and lung disease.[4] Because the preferred alternative will include several years of construction near a large population center, EPA has identified several mitigation

7

[3] See the studies referenced by the American National Standard Acoustical Performance Criteria, Design Requirements, and Guidelines for Schools.

[4] https://www3.epa.gov/region1/eco/diesel/health_effects.html

measures to further reduce emissions related to construction, to supplement the discussion in Section 3.3.3.2.

Recommendations: EPA recommends IDOT/FHWA consider the following protective measures and commit to applicable measures in the ROD.

Mobile and Stationary Source Diesel Controls

Purchase or solicit bids that require the use of vehicles that are equipped with zero-emission technologies or the most advanced emission control systems available. Commit to the best available emissions control technologies for project equipment in order to meet the following standards.

- On-Highway Vehicles: On-highway vehicles should meet, or exceed, the EPA exhaust emissions standards for model year 2010 and newer heavy-duty, on-highway compression-ignition engines (e.g., long-haul trucks, refuse haulers, shuttle buses, etc.).5
- Non-road Vehicles and Equipment: Non-road vehicles and equipment should meet, or exceed, the EPA Tier 4 exhaust emissions standards for heavy-duty, non-road compression-ignition engines (e.g., construction equipment, non-road trucks, etc.).6
- Low Emission Equipment Exemptions: The equipment specifications outlined above should be met unless: 1) a piece of specialized equipment is not available for purchase or lease within the United States; or 2) the relevant project contractor has been awarded funds to retrofit existing equipment, or purchase/lease new equipment, but the funds are not yet available.

7

Consider requiring the following best practices through the construction contracting or oversight process:

- Use onsite renewable electricity generation and/or grid-based electricity rather than diesel-powered generators or other equipment.
- Use ultra-low sulfur diesel fuel (15 ppm maximum) in construction vehicles and equipment.
- Use catalytic converters to reduce carbon monoxide, aldehydes, and hydrocarbons in diesel fumes. These devices must be used with low sulfur fuels.
- Use electric starting aids such as block heaters with older vehicles to warm the engine.
- Regularly maintain diesel engines to keep exhaust emissions low. Follow the manufacturer's recommended maintenance schedule and procedures. Smoke color can signal the need for maintenance (e.g., blue/black smoke indicates that an engine requires servicing or tuning).
- Retrofit engines with an exhaust filtration device to capture diesel particulate matter before it enters the construction site.
- Repower older vehicles and/or equipment with diesel- or alternatively-fueled engines certified to meet newer, more stringent emissions standards (e.g., plug-in hybrid-electric vehicles, battery-electric vehicles, fuel cell electric vehicles, advanced technology locomotives, etc.).
- Retire older vehicles, given the significant contribution of vehicle emissions to the poor air quality conditions. Implement programs to encourage the voluntary removal from use and the marketplace of pre-2010 model year on-highway vehicles (e.g., scrappage

[5] http://www.epa.gov/otaq/standards/heavy-duty/hdci-exhaust.htm
[6] http://www.epa.gov/otaq/standards/nonroad/nonroadci.htm

rebates) and replace them with newer vehicles that meet or exceed the latest EPA exhaust emissions standards. 7

Fugitive Dust Source Controls

- Stabilize open storage piles and disturbed areas by covering and/or applying water or chemical/organic dust palliative, where appropriate. This applies to both inactive and active sites, during workdays, weekends, holidays, and windy conditions.
- Install wind fencing and phase grading operations where appropriate, and operate water trucks for stabilization of surfaces under windy conditions. 8
- When hauling material and operating non-earthmoving equipment, prevent spillage and limit speeds to 15 miles per hour (mph). Limit speed of earth-moving equipment to 10 mph.

Occupational Health

- Reduce exposure through work practices and training, such as turning off engines when vehicles are stopped for more than a few minutes, training diesel-equipment operators to perform routine inspection, and maintaining filtration devices.
- Position the exhaust pipe so that diesel fumes are directed away from the operator and nearby workers, reducing the fume concentration to which personnel are exposed.
- Use enclosed, climate-controlled cabs pressurized and equipped with high-efficiency particulate air (HEPA) filters to reduce the operators' exposure to diesel fumes. Pressurization ensures that air moves from inside to outside. HEPA filters ensure that any incoming air is filtered first. 9
- Use respirators, which are only an interim measure to control exposure to diesel emissions. In most cases, an N95 respirator is adequate. Workers must be trained and fit-tested before they wear respirators. Depending on the type of work being conducted, and if oil is present, concentrations of particulates present will determine the efficiency and type of mask and respirator. Personnel familiar with the selection, care, and use of respirators must perform the fit testing. Respirators must bear a NIOSH approval number.

Community Outreach

EPA notes IDOT/FHWA's continued commitment to meaningful public engagement throughout the NEPA process. Based on conversations held in November 2016, we understand IDOT/FHWA are considering hiring a community liaison during the construction and early phases of operation. We commend this approach and have several recommendations regarding the role of a community liaison to further address potential human health and environmental concerns, particularly during construction.

Recommendations: If IDOT/FHWA ultimately hire a community liaison, we recommend a candidate with some community or public health experience. We recommend the community liaison be hired before construction begins. As discussed above, under *Children's Health,* a community liaison could coordinate the Air Quality Flag Program and other communication efforts, particularly with schools and childcare centers. 10

The Draft EIS describes the existing website as a means to provide project information to the public and receive comments. Key project information is also provided in Spanish. It is unclear whether IDOT/FHWA intend to retain the website during construction and the early stages of operation.

Recommendation: EPA recommends the website remain active during construction and early phases of operation. In addition to construction-related impacts (including anticipated duration, extent, and timing of emissions, noise, vibration, and accessibility), we recommend adding the 11

above-referenced community liaison's contact information and how impacted community members can ask questions or lodge complaints or concerns, particularly during the mainline construction phase. Any special or negotiated provisions (such as no construction within a certain distance of a school during school hours, as recommended above under *Children's Health*) or mitigation measures committed to in the ROD should also be included on the website. 11

Final Design Elements

EPA commends the following measures, which are part of the build alternatives. We recognize that many details regarding implementation will not be identified until the final design and implementation may rely on local funding or co-sponsorship. However, we encourage IDOT/FHWA to continue pursuit of these elements, which enhance the overall quality of the project and support meaningful public engagement. We commend the following measures, as they improve the overall quality of the human and natural environment within the project corridor.

Recommendations: We recommend the continued coordination and ultimate incorporation of the following features into the ROD and final design, where appropriate.

- The Draft EIS has outlined several sustainability measures proposed for implementation along the project corridor. Measures potentially include increases in green space and vegetated edging, as outlined in Section 3.1.6.2. IDOT/FHWA are also reducing flooding by incorporating improvements to local drainage systems, which include future storm sewer connections. The Village of Oak Park is considering solar gardens and solar panels on noise walls in conjunction with project construction. EPA commends each of these efforts and recommends continued coordination into final design. 12
- EPA commends IDOT/FHWA's consideration of Context Sensitive Solutions (CSS), as detailed in Section 3.13.5.1. CSS features physical infrastructure designed with community input in terms of public art, texture, forms, themes, and colors. We recommend continued work with the community to improve the visual quality of the proposed infrastructure. In particular, we recommend considering public art along noise and retaining walls and under bridges (accessible to pedestrians and bicycles) to limit graffiti.
- EPA commends IDOT/FHWA's commitment to Complete Streets provisions at interchanges. We also note incorporation of multi-modal features, such as bike lanes, pedestrian bridges at Home and Lavergne Avenues, and connections to the Illinois Prairie Path. EPA also notes the associated improvements to Chicago Transit Authority (CTA) infrastructure, including station access to arterial roads and bus stops. Continued coordination with CTA will ensure access is not impeded during construction, maintaining transit ridership.
- IDOT/FHWA have coordinated with the Chicago Park District (CPD) to provide a shared use path to connect Austin Boulevard with Columbus Park. Design of the shared-use path also includes berms and landscaping, increasing the park's tree canopy. IDOT/FHWA have identified mitigation measures to replace existing or add new areas of landscaping and hardscaping, including placement of narrow planting strips along retaining walls or noise walls. EPA recommends use of native, non-invasive species along the corridor.
- EPA commends the extensive and ongoing public outreach by the IDOT/FHWA project team. We recommend continued conversations with the impacted communities, particularly as details regarding noise walls, project design, and access emerge.

DUPAGE COUNTY

February 7, 2017

Mr. Randall S. Blankenhorn, Secretary
Illinois Department of Transportation
Hanley Building
2300 S. Dirksen Parkway
Springfield, IL 62764

Dear Mr. Blankenhorn:

Thank you for hosting the recent public hearings regarding the I-290 Draft Environmental Impact Statement (DEIS). DuPage County has been a participating partner in this study to enhance safety and reduce congestion for the hundreds of thousands of motorists that use I-290 for both work and pleasure trips each day, many from DuPage County. The preferred alternative as presented will provide an additional, 4th, lane west of Cicero Ave to match the four lanes east of Cicero. The 4th lane is proposed to be a high-occupancy toll (HOT) lane for its entirety, both the proposed new lane as well as the existing (free) 4th lane. The improvements also include reconstruction/rehabilitation of the existing I-290, bridge replacements, interchange reconfigurations and accommodations for pedestrians and access to future transit opportunities (rail /bus). The estimated construction cost is about $2.6B and work is projected to occur over an 8-year period. Presently, no funding has been identified for future phases of work.

As we understand, the HOT Lane concept being proposed is for operational purposes only. Through a variable pricing structure, motorists will be assured of a predictable and efficient travel option for in-bound/out-bound trips, at a cost. While DuPage County remains supportive of improvements that reduce travel times and increase reliability, we are concerned that our citizens will be disproportionately financially burdened. We look forward to continuing to participate in discussions to ensure equity for all users. 1

Recently, I and the other County Board Chairs from northeast Illinois co-signed a letter to USDOT Secretary Chao urging her support for increased transportation funding (not financing). Improvements to I-290 have been long over-due. Its importance in serving our regional economy cannot be overstated. I encourage IDOT to prioritize I-290 within its transportation funding program, including advance parallel arterial corridors such as Illinois 64, Illinois 38 and Illinois 56/Cermak, and as a State priority for federal funding assistance. 2

Sincerely,

Daniel J. Cronin

BUREAU OF PROGRAMMING
RECEIVED
JAN 30 2017
DISTRICT #1

Mr. John Fortmann, P.E.
Deputy Director of Highways, Region One Engineer
Office of Highways Project Implementation/Region One/District One
201 West Center Court
Schaumburg, IL 60196-1096

Attention: Mr. Peter E. Harmet, P.E.
Bureau Chief of Programming

Dear Mr. Fortmann:

Subject: I-290 Draft Environmental Impact Statement

Reference is made to your letter dated December 21, 2016, concerning the subject matter. The Metropolitan Water Reclamation District of Greater Chicago (MWRDGC) has reviewed the Draft Environmental Statement and has the following comments:

1. All MWRDGC facilities must be protected and 24-hour access provided during construction. We met with IDOT staff on November 6, 2015, and provided input to a preliminary design for routing our intercepting sewer under First Avenue. The design has subsequently been altered, and we will continue to work with you to ensure your project goals are met and all of our facilities are not impacted. 1

2. Section 3.7.1.3. There are some errors on Page 3-177 concerning CAWS water quality standards, as shown below:

   As of July 1, 2015, the South Branch of the Chicago River, as part of the Chicago Area Waterway System, has newly approved water quality standards (Title 35 Illinois Administrative Code, Part 302, Subpart D - Illinois Environmental Protection regulation). The ~~secondary contact~~ *Indigenous Aquatic Life* stream use has been replaced with "~~Indigenous~~ *Chicago Area Waterway System* Aquatic Life Use A" standards. The *South Branch* Chicago 2

River has specific dissolved oxygen and chloride water quality standards. From July 1, 2015 to July 1, 2018, the following applies: • Chloride: 500 milligrams per liter (mg/L) (May 1 thru November 30); • Total Dissolved Solids: 1,500 mg/L (December 1 thru April 30); and Dissolved Oxygen: minimum of 5.0 mg/L (March thru July); 4.0 mg/L daily minimum average over seven days; and 3.5 mg/L at any time (August thru February). After July 1, 2018, the water quality standard in effect for chlorides would be 500 mg/L. *and the Total Dissolved Solids water quality standard will be repealed.* 2

3. Section 3.9.2.3. Figure 3-58 should include a note that the new outlet pipe from First Avenue to the Des Plaines River would be designed to hold the 10-year frequency as shown in the areas directly to the west. 3

4. Section 3.9.1.1

   a. The last sentence of the second paragraph should state: "The reservoir is in the final design phase and is expected to be completed in three years (estimated completion in 2020)." 4

   b. Add a sentence at the end of the third paragraph stating: "The channel improvements are in the final design phase and are expected to be completed in four years (estimated completion 2021)." 5

5. Section 3.9.2.1. After the paragraph on p. 3-197 that begins with "Longitudinal…", please add the following paragraph: "MWRDGC has been working with IDOT on the Addison Creek Reservoir and Channel Improvements projects. IDOT and MWRDGC staff met during MWRDGC's preliminary design phase, and more recently on July 26, 2016. Hey and Associates, Inc., continues to coordinate with IDOT. Also, MWRDGC has provided IDOT with modeling information." 6

Questions may be referred to Joe Schuessler, Principal Civil Engineer, at (312) 751-3236.

Very truly yours,

Catherine A. O'Connor

Project: I-290 Study

Individual: Doug Kaarre Title: Urban Planner

Organization: Village of Oak Park Location: Oak Park, Illinois

Phone No.:

Subject: I-290 DEIS - Hulbert Historic District

Items Discussed:

Mr. Kaare stated that the Hulbert Historic District as show in the DEIS was not properly delineated. The Historic District extends east-west from Clinton Avenue to South Kenilworth Avenue but includes the houses on both sides of the street. The delineation in the DEIS only identifies the limit as extending from Clinton Avenue to S. Kenilworth Avenue but not the houses west of Clinton and east of Kenilworth. 1

The correction to the limits will effect both the Section 3.0 Map Set (page 7 of 16) and the APE Limit exhibits (page 10 of 21).

Comments or Action Required:

I stated that we would make the corrections to the delineations on both the Map Set and APE Limits.

Re: Request for extension of time for public comment period for the I-290 (Eisenhower Expressway) Draft Environmental Impact Statement

Dear Mr. Harmet:

The Village of Oak Park is formally requesting that the Illinois Department of Transportation extend the public comment period for the I-290 (Eisenhower Expressway) Draft Environmental Impact Statement (DEIS) for an additional 45 days. Please consider this request for an extension in time as the DEIS is a large document which requires a considerable amount of time to review and issue comment on.

Should you have any questions please feel free to call me at 708-358-5722.

Sincerely,

VILLAGE OF OAK PARK

Re: **Public comments from the Village of Oak Park for the I-290 (Eisenhower Expressway) Draft Environmental Impact Statement**

Dear Mr. Harmet:

The Village of Oak Park has completed a review of the Draft Environmental Impact Statement (DEIS) for the I-290 reconstruction project and has no comments at this time. The Village of Oak Park has a Letter of Intent (LOI) with the Illinois Department of Transportation which confirms the Village's concurrence with the proposed improvement, defines cost participation responsibilities, and the maintenance/jurisdictional responsibilities for the project. Although no conflicts between the LOI and DEIS were found by staff during the Village's review of the DEIS, should the DEIS contain conflicts with the LOI the DEIS should be revised to reflect commitments contained in the LOI. 1

Should you have any questions please feel free to call me at 708-358-5722.

Sincerely,

VILLAGE OF OAK PARK

RE: Eisenhower Expressway Draft Environmental Impact Statement (DEIS)

Dear Mr. Harmet and Mr. Peterson:

The Active Transportation Alliance is a non-profit organization advocating for better biking,walking and transit. We are not anti-car, but we do think it's important to give people more and better non-auto options. We are pleased to present comments on the Eisenhower Expressway Draft Environmental Impact Statement (DEIS).

Our comments are shaped by this reality: the region has seen a sharp increase in driving over the past 60 years, with a steep rise in the percentage of trips using motor vehicles vs. other modes. In fact, for most residents of the region, they rarely leave their homes without a car because that is often the only way to get to their destinations. More than 90 percent of all work trips originating in the suburbs are by car. It's no wonder, then, that our roads are so congested. 1

The regional Go to 2040 Plan lays out a vision for reducing car dependency by increasing the use of transit and other non-auto modes. The plan comes up short, in our opinion, as full implementation would make a modest difference at best with our over-dependence on cars and the congestion, noise, expense, injuries, community disruption and economic inequity that go along with it.

Making matters worse, Go to 2040 implementation has been heavily weighted towards roads and personal automobiles, which means the region isn't just doing too little but is actually moving in the wrong direction when it comes to regionally significant transportation projects. Projects completed or

nearly completed include the Elgin O' Hare Expressway, Jane Adams Tollway widening, Jane Adams interchange, and the I-294/I-57 interchange, and the state is moving relatively quickly to add lanes to the Kennedy and Eisenhower expressways.

Meanwhile, the transit agencies have struggled to fund basic maintenance and a handful of new stations, with little to no expansion in sight. It's no surprise that VMT is increasing and transit ridership decreasing recently, and the region lacks a meaningful vision for how to break from the status quo and give people - especially in the suburbs - better transportation options. 1

With this in mind, our main concern with the Eisenhower DEIS is that IDOT has selected an alternative that will spend billions of dollars while doing relatively little to reduce congestion within the corridor, a key component of the Purpose and Need, compared to doing nothing – the "No-Build"alternative. At the same time, the preferred alternative would increase the amount of driving in the region and the commensurate negative environmental, congestion, and safety impacts. Moreover, by further exacerbating car dependency and land use patterns that undermine non-auto modes, IDOT's preferred alternative makes it that much harder for people who cannot afford a car to get to work, school and other destinations. Each of these points are more important when one considers the cumulative impacts of the many highway expansion projects IDOT and ITHA are pursuing, rather than the Ike proposal in isolation as the DEIS does. 2

IDOT's study and the DEIS fail to comprehensively assess the regional transportation network, of which the Eisenhower is one component or segment, by considering a combination of travel demand reduction and transit strategies within and outside the study corridor that can achieve similar travel benefits within the corridor for far less cost, with less environmental impacts, and with fewer "upstream and downstream" impacts.

Because the preferred alternative adds toll + carpool lanes in each direction, rather than converting existing lanes, it would lead to more driving compared to the No-Build according to IDOT modelng. This reinforces research and real world experience that shows adding highway capacity in congested metropolitan areas leads to more driving that erodes congestion benefits. Indeed, IDOT predicts 16.25 hours of congestion per day in the year 2040 compared to 18 hours per day with the No-Build, a small improvement, even though the new lanes would incentivize carpools of three or more people. 3

In fact, under IDOT's preferred alternative, the vast majority of people traveling through the corridor will continue to use single occupancy vehicles that weigh thousands of pounds and are 80 percent empty. This is a wasteful use of public space but a very effective way to create traffic jams. 4

Nearby parallel surface streets are expected to see less traffic compared to the No-Build, but by stimulating additional driving within the Eisenhower corridor, on a regional level one would expect- and the IDOT modeling predicts - more driving on many of the surface streets and highways that people use to reach the Eisenhower along with commensurate increases in environmental impacts, traffic congestion, crashes and injuries. And by encouraging more driving, the preferred alternative will reinforce car-dependent development patterns across the region that undermine other, less environmentally harmful travel modes like walking, biking and transit. 5

It's also worth noting that the safety benefits of redesigning the Eisenhower are undercut by the necessity to use narrower 11 foot lanes to accommodate additional car lanes. IDOT expects an increase in side swipe crashes because of the 11 foot lanes. 6

Better utilization of the Blue Line should be a priority for any plan to improve travel in this corridor, but it's not a part of the preferred alternative even though IDOT committed to funding and planning for improvements to the CTA Blue Line and the Eisenhower Expressway as one project. Moreover, the Blue Line DEIS is many months behind the Eisenhower EIS. 7

Finally, the introduction of autonomous vehicles and new mobility services could dramatically reduce VMT over time, making highway expansion an even worse investment. The IDOT study process and DEIS do not directly assess the potential effects of these game-changing innovations. 8

In short, the Active Transportation Alliance believes the study process and the DEIS fail to

1. adequately account for the environmental, safety, and traffic impacts that spurring more driving will cause outside the study area because there is more driving associated with trips going to and from the corridor. 9

2. consider a better alternative, one that uses demand-side strategies to reduce driving and enhanced transit service within and connecting to the corridor. This approach can effectively address congestion (and the Purpose and Need more broadly) with far less expense and environmental impacts. IDOT should have evaluated such strategies beyond the current study area given that so many trips within the corridor start and end outside the study area. 10

3. adequately assess the extent to which the preferred alternative would spur more driving outside the study area by undermining the viability of other transportation modes. 11

4. adequately assess the extent to which people who cannot afford a car would be further disadvantaged because the preferred alternative reinforces car dependency across the region, and because low income residents are less able to afford the HOT lane tolls. 12

Thanks for your consideration.

RE: Eisenhower Expressway Draft Environmental Impact Statement (DEIS)

Dear Mr. Harmet and Mr. Peterson:

The Active Transportation Alliance is a non-profit organization advocating for better biking, walking and transit. We are not anti-car, but we do think it's important to give people more and better non-auto options. We are pleased to present comments on the Eisenhower Expressway Draft Environmental Impact Statement (DEIS).

Our comments are shaped by this reality: the region has seen a sharp increase in driving over the past 60 years, with a steep rise in the percentage of trips using motor vehicles vs. other modes. In fact, for most residents of the region, they rarely leave their homes without a car because that is often the only way to get to their destinations. More than 90 percent of all work trips originating in the suburbs are by car. It's no wonder, then, that our roads are so congested.

1

The regional Go to 2040 Plan lays out a vision for reducing car dependency by increasing the use of transit and other non-auto modes. The plan comes up short, in our opinion, as full implementation would make a modest difference at best in our over-dependence on cars and the congestion, noise, expense, injuries, community disruption and economic inequity that go along with it.

Making matters worse, Go to 2040 implementation has been heavily weighted towards roads and personal automobiles, which means the region isn't just doing too little but is actually moving in the wrong direction when it comes to regionally significant transportation projects.

Completed or nearly-completed regionally significant projects include the Elgin O' Hare Expressway/I-390 widening, Jane Adams Tollway widening, Jane Byrne interchange, and the I-294/I-57 interchange, and the state is moving relatively quickly to add lanes to the Kennedy, Eisenhower and Tri-State expressways and to extend I-390 east.

Meanwhile, the transit agencies have struggled to fund basic maintenance and a handful of new stations, with little expansion in sight. It's no surprise that VMT is increasing and transit ridership decreasing recently, and the region lacks a meaningful vision for how to break from the status quo and give people better transportation options.

1

With this in mind, our main concern with the Eisenhower DEIS is that, compared to the “No-Build” alternative, IDOT’s preferred alternative will cost billions of dollars while doing relatively little to reduce congestion within the corridor - a key component of the Purpose and Need. At the same time, the preferred alternative would increase the amount of driving in the region and the commensurate negative environmental, congestion, and safety impacts.

Moreover, by further exacerbating car dependency and land use patterns that undermine non-auto modes, IDOT’s preferred alternative makes it that much harder for people who cannot afford a car to get to work, school and other destinations. Each of these points are more important when one considers the cumulative impacts of the many highway expansion projects IDOT and ITHA are pursuing, rather than the Ike proposal in isolation as the DEIS does.

2

Given that the Eisenhower is but one component or segment of a larger transportation system that moves people and goods to, from and within the corridor, and given that the highway is over-capacity largely because of excessive vehicle demand that originates outside the corridor, it is imperative that IDOT not limit its alternatives to supply-side strategies within the corridor. However, that is exactly what IDOT did.

3

Alternatives presented by IDOT fail to include the application of demand-side strategies – also known as Transportation Demand Management (TDM) - inside or outside the corridor. According to Mobility Labs, "TDM has come into increased favor in the United States in recent years as planners have realized that it's much cheaper to proactively manage (or attempt to manipulate) the demand on a transportation network – or a system of roads – than it is to increase capacity on that same network."

Metro Chicago is far behind its peer regions in the use of employer-based incentive/transportation programs, carpool lanes and carpool bypass ramps, parking pricing and other TDM strategies. IDOT's alternatives also omit transit innovations like enhanced bus service to Blue Line and Metra stations and Transit Oriented Development incentives. TDM plus transit innovations could achieve similar benefits as IDOT's preferred alternative for far less cost, with less environmental impacts, and with fewer "upstream and downstream" impacts.

4

Because the preferred alternative adds toll + carpool lanes in each direction, rather than converting existing lanes, it would lead to more driving compared to the No-Build according to IDOT modeling. (As already happened with the Elgin O'Hare/I-390, federal legislation would be needed to convert to tolled lanes; conversation to carpool lanes does not require legislation.) This reinforces research and real world experience that shows adding highway capacity in congested metropolitan areas

5

leads to more driving that erodes congestion benefits. Indeed, IDOT predicts 16.25 hours of congestion per day in the year 2040 compared to 18 hours per day with the No-Build, a small improvement, even though the new lanes would incentivize carpools of three or more people. 5

In fact, under IDOT's preferred alternative, the vast majority of people traveling through the corridor will continue to use single occupancy vehicles that weigh thousands of pounds and are 80 percent empty. This is a wasteful use of public space but a very effective way to create traffic jams. 6

Nearby parallel surface streets are expected to see less traffic compared to the No-Build, but by stimulating additional driving within the Eisenhower corridor, on a regional level one would expect - and the IDOT modeling predicts - more driving on many of the surface streets and highways that people use to reach the Eisenhower along with commensurate increases in environmental impacts, traffic congestion, crashes and injuries. And by encouraging more driving, the preferred alternative will reinforce car-dependent development patterns across the region that undermine other, less environmentally harmful travel modes like walking, biking and transit. 7

It's also worth noting that the safety benefits of redesigning the Eisenhower are undercut by the necessity to use narrower 11 foot lanes to accommodate additional car lanes. IDOT expects an increase in side swipe crashes because of the 11 foot lanes. 8

Better utilization of the Blue Line should be a priority for any plan to improve travel in this corridor, but it's not a part of the preferred alternative even though IDOT committed to funding improvements to the CTA Blue Line and the Eisenhower Expressway as one project. Moreover, the Blue Line DEIS is many months behind the Eisenhower DEIS. 9

Also note that FHWA recently changed its congestion rules, in which delay is measured in “person-hours” to better assess how well a corridor moves people instead of cars. Alternatives that include the Blue Extension would likely score better under this approach. 10

Finally, the introduction of autonomous vehicles and new mobility services could dramatically reduce VMT over time, making highway expansion an even worse investment. The IDOT study process and DEIS do not directly assess the potential effects of these game-changing innovations. 11

In short, the Active Transportation Alliance believes the study process and the DEIS fail to:

1. adequately account for the environmental, safety, and traffic impacts that spurring more driving will cause outside the study area because there is more driving associated with trips going to and from the corridor. 12

2. consider a better alternative, one that uses TDM to reduce driving (especially during peak hours) and enhanced transit service within and connecting to the corridor. This approach can effectively address congestion (and the Purpose and Need more broadly) with far less expense and environmental impacts. IDOT should have evaluated such strategies inside and outside the study area given that so many trips within the corridor start and end outside the study area. 13

3. adequately assess the extent to which the preferred alternative would spur more driving outside the study area by undermining the viability of other transportation modes. 14

4. adequately assess the extent to which people who cannot afford a car would be further disadvantaged because the preferred alternative reinforces car dependency 15

across the region, and because low income residents are less able to afford the tolled lanes. 15

Thanks for your consideration.

SUBJECT: Draft Environmental Impact Statement (DEIS)

Dear Mr. Harmet and Mr. Peterson:

Thank you for the opportunity to submit comments on the DEIS. Please accept our thanks for an enormous amount of work. We have grouped our comments into six categories: Purpose and Need, Alternatives, Impacts, Evaluation, Citizen Participation, and General Comments.

1. PURPOSE AND NEED

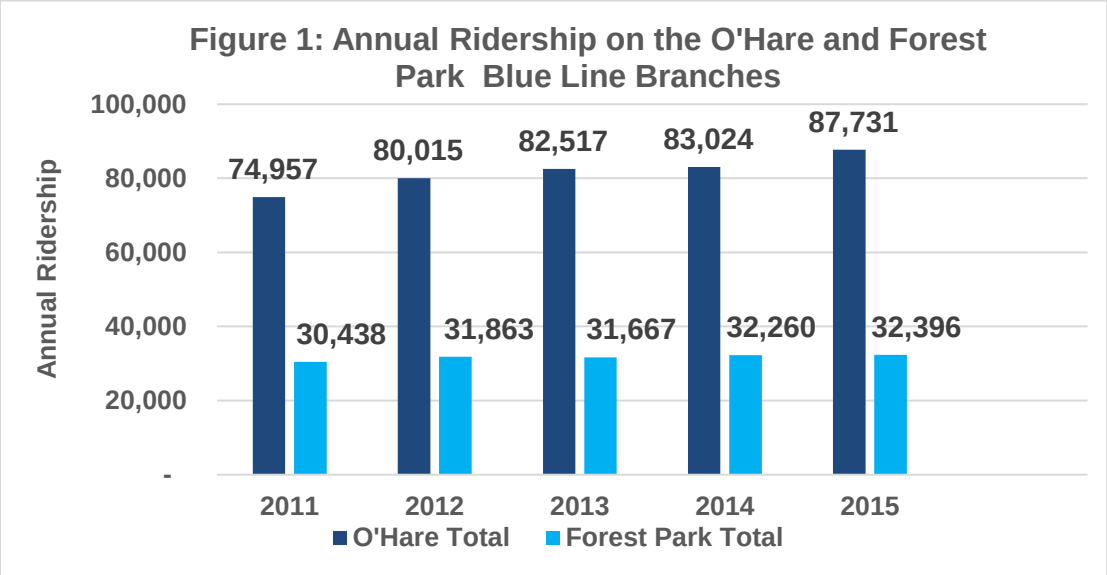
a. IDOT's Goal

IDOT should include their overall goal ("Create an asset for adjoining communities") in Chapter 1: Purpose and Need. To achieve this goal, both IDOT and the adjoining communities have important roles. The proposed IDOT and CTA investments in the Corridor are substantial, so they will have economic, social, and environmental impacts. The Chicago Metropolitan Agency for Planning Go To 2040 plan says most of our region's future growth should occur in existing communities. Community economic development efforts benefit from transportation investments. 1

IDOT says, "*any redevelopment of the land uses along the I-290 corridor is beyond the scope of this (or any) transportation project.*"[1] Having IDOT do economic development is not appropriate, but having IDOT modify the design of the expressway to facilitate development is.

b. Livability

[1] Letter from John Fortmann and Peter Harmet at the Illinois Department of Transportation to Rick Kuner, Citizens for Appropriate Transportation, July 29, 2013, Page 4.



IDOT should include livability features in the Purpose and Need Statement. Pennsylvania DOT and New Jersey DOT include livability features in their projects[2]. 2

2. ALTERNATIVES

Good solutions are multi-modal for both Traditional and Reverse Commutes. They create a better economic climate that will encourage investments in our communities. They meet social goals. They reduce negative impacts on the environment. They increase the livability of our communities. They make financial sense.

a. Capacity

IDOT's Preferred Alternative will not have enough capacity to eliminate congestion. The CTA Forest Park Branch has excess capacity. The more people who choose transit over driving, the less congestion on the expressway and the more revenue for the CTA. For every rider on the Forest Park Branch of the CTA Blue Line, there are 2.5 to 2.7 riders on the O'Hare Branch, so there is unused capacity on the Forest Park Branch (see Figure 1). Driverless cars and crash avoidance systems may increase expressway capacity, but when and by how much is uncertain. The CTA already transports Captive Riders (no access to a car), but needs to attract more Choice Riders (access to a car, but choose transit). 3

Hours of Congestion – IDOT's prior analysis shows that weekday congestion on the existing general purpose lanes is about 17 hours a day, which is projected to be 18 hours a day by 2040 under the 2040 No Build Alternative. Of the four Build Alternatives IDOT considered, the best one would reduce this to 16¼ hours on a weekday for the

[2] "Smart Transportation Guidebook – Planning and Designing Highways and Streets that Support Sustainable and Livable Communities," New Jersey Department of Transportation and Pennsylvania Department of Transportation, March 2008.

general purpose lanes. For the HOT 3+ lanes, IDOT's analysis shows lower congestion levels. These numbers do not appear in the DEIS. Why did IDOT exclude them?

Four of the eight lanes in the Preferred Alternative are 11 feet wide even though the interstate standard is 12 feet. The other four lanes are 12 feet wide. Eleven-foot lanes tend to increase sideswipe accidents. IDOT's approach is to look at the impact of all design features on crashes and accept a higher crash rate for 11-foot lanes if there are design features that lower the crash rate elsewhere. 3

b. Crashes

The expressway section under study has about 2,500 crashes a year while the CTA has zero crashes in most years. This makes the CTA a desirable and viable option assuming a reduction in the number of pickpocket, theft, and robbery incidents. 4

c. Blue Line Role

Good transit service means a better quality of life for families without cars, young children, and senior citizens. The CTA Forest Park Blue Line branch can carry many more commuters with less negative impacts than widening the expressway.

Transit needs dense development to function effectively. The inner West Cook County suburbs have the necessary density. Recent development trends suggest density on Chicago's West Side will increase in the future, providing additional demands for CTA rail service. Requiring transit-oriented development around stations will help transit and land use work better. Zoning codes that allow transit-appropriate density within walking distance of stations is another good policy.

The Blue Line extension will have more riders if it includes large park-and-ride lots, feeder bus service to the stations, kiss-and-ride, and bicycle racks or storage lockers. A pricing structure that encourages the use of park-and-ride or feeder bus as an alternative to driving into downtown Chicago will also help. 5

The CTA should extend the Blue Line to at least 1st Avenue in Maywood. Not extending the Blue Line west of Forest Park will mean more expressway congestion and it hurts Maywood. The CTA already owns the right-of-way from the Forest Park Yards to the east side of the Des Plaines River. The further west the CTA intercepts drivers via Park-and-Ride facilities, the better because that will reduce the number of vehicles on the expressway. The CTA schedule for the Blue Line has 4 to 9 minute headways during peak periods. The CTA's signal system can handle headways of less than four minutes. The CTA is not extending it because other projects have higher priority and the lack of funding.

For IDOT, reconstructing and widening the expressway in the six-lane section is a priority. For the CTA, rebuilding the existing Forest Park Branch of the CTA is a priority; extending the Blue Line is not. Because of different priorities and funding programs, it is possible IDOT will improve the expressway years before any extension of the Blue Line takes place. Corridor residents and businesses may not see the full benefits from multi-modal planning for years.

d. CSX Right-of-Way

The CSX railroad says none of their right-of-way is available, which means higher bridges at Austin and Harlem and four 11-foot lanes. There is a provision in the Letter of Intent between IDOT and the Village of Oak Park to reopen this issue if some of the CSX right-of-way becomes available, but this is not mentioned in the DEIS. 6

e. HOT 3+ Experience

HOT lanes are hard to manage. They have five purposes: (1) decrease travel time, (2) increase the person capacity of an expressway, (3) increase trip reliability, (4) decrease air pollution, and (5) increase revenue. To use HOT 3+ lanes, the driver must find two more people, pick them up, and drop them off at convenient locations. People who work late or irregular hours, use their cars during the day, park free at work, have young children or aging parents, or who run errands during their commute are less inclined to car pool. The extra time required picking up and dropping off extra people reduces travel time savings. Too much traffic means motorists do not get the promised travel time reduction. Too little traffic wastes roadway capacity. Some projects have not met revenue projections. The major equity questions are: (1) do agency polices treat people in the same group equally, (2) do users pay the full cost, (3) do low-income groups pay a disproportionate share, (4) do tolls cause drivers to divert to neighborhood streets, and (5) are there better alternatives? 7

f. Development Opportunities

When properly designed, major transportation improvements have positive effects on social, economic, and environmental conditions in the corridor. Major roadways provide mobility for people and goods. Mobility clearly affects the choices we make about where to live, work, shop, and carry out other activities. "*Transportation decisions cannot be separated from community values and public policy. The point of CSD (Context-Sensitive Design) is to satisfy not just the user of the road, but also the community it impacts. A roadway must be safe for both the user and the community; be in harmony with the community; and preserve environmental, scenic, aesthetic, historic, and natural resource values of the area. It should cause minimal disruption and add lasting value to the community*."[3] IDOT's Build Alternatives create development opportunities. The Envision Oak Park Comprehensive Plan identifies eleven Transit Area Housing Development Opportunity sites along the corridor.[4] 8

g. Design

A good design for the Eisenhower Corridor must address the needs for all transportation modes, add value to the adjacent communities, and be compatible with the built and natural environments. Every transportation mode (expressway, rail transit, buses, pedestrians, and bicyclists) plays a role. When each mode is designed to do what it does best, the transportation system works better and is efficient. One fundamental 9

[3] "Context Sensitive Design, Designing with the Community," Joan L. Suchomel, Citizens for Appropriate Transportation, Issue Brief 10: April 2003.

[4] Envision Oak Park – A Comprehensive Plan for the Oak Park Community. Adopted September 15, 2014. Pages 62 and 63

principle of transportation is good design is always better than good enforcement or regulation. Good design is there 24/7. Good enforcement cannot be there 24/7.

The design of corridor edges is critical because both residential and non-residential uses are close to the Corridor. The fact that neighbors in Oak Park built the wood fence on Harrison from Grove to Wenonah along the northern edge of the expressway more than twenty-five years ago is powerful evidence of the importance of corridor edge design. Neighbors have maintained and replaced sections as needed.

IDOT's proposed shoulder widths are substandard, putting police, fire/paramedics, and motorists at risk.

Context Sensitive Solutions - IDOT is following a Context Sensitive Solutions process for the Phase 1 Study, but there has never been a presentation from either an urban designer or architect at any of the Corridor Advisory Group/Task Force meetings.

9

h. Demand Management and Congestion Pricing

Using a combination of demand management techniques can have a significant impact. Individual techniques to reduce demand have a limited impact, but in combination, they can have a significant impact. Some of these techniques are flextime, car and vanpools, working at home, and staggered work hours.

10

i. Interchanges

IDOT's proposed right side ramps at Austin and Harlem are longer, higher, and closer to residential neighborhoods than the current center ramps. Right-hand side ramps will have negative air and noise impacts, and can hurt property values. Motorists who want to use the HOT 3+ lanes will enter the expressway on right side ramps and cross three lanes to get to the HOT 3+ lanes. This is likely to increase the accident rate.

11

j. Diversion of Traffic to Local Streets

Alternatives with tolls divert traffic to neighborhood arterial streets as drivers seek to avoid paying to use the expressway.

12

3. IMPACTS

a. Air Quality

The air quality analysis is incomplete. IDOT should update it in Phase 2: Working Drawings and Specifications. IDOT says,

- *"According to this analysis, the build alternatives would have minimal effects on regional criteria pollutant burdens, with changes of less than one percent, as compared to the No Build Alternative."*[5]

13

[5] Draft Environmental Impact Statement, Chapter 3: "Environmental Resources, Impacts, and Mitigation," December 2015, Page 3-118.

- *"… the USEPA has classified the portion of Cook County in which the proposed project is located as a nonattainment area for O_3 and has designated the entire state as unclassifiable for the 2012 $PM_{2.5}$ NAAQS."*[6]
- *"For the eight-hour ozone standards, Cook, DuPage, Kane, Lake, McHenry, and Will counties, as well as Aux Sable and Goose Lake townships in Grundy County and Oswego Township in Kendall County, have been designated as nonattainment areas for ozone."*[7]
- *"In FHWA's view, information is incomplete or unavailable to credibly predict the project-specific health impacts due to changes in MSAT*[8] *emissions associated with a proposed set of highway alternatives. The outcome of such an assessment, adverse or not, would be influenced more by uncertainty introduced into the process through assumption and speculation rather than any genuine insight into the actual health impacts directly attributable to MSAT exposure associated with a proposed action."*[9]
- *"The methodologies for forecasting health impacts include emissions modeling; dispersion modeling; exposure modeling; and then final determination of health impacts with each step in the process building on the model predictions obtained in the previous step. All are encumbered by technical shortcomings or uncertain science that prevents a more complete differentiation of the MSAT health impacts among a set of project alternatives. These difficulties are magnified for lifetime (i.e., 70 year) assessments, particularly because unsupportable assumptions would have to be made regarding changes in travel patterns and vehicle technology (which affects emissions rates) over that time frame, since such information is unavailable."*[10]

13

The "Air Pollution Action Day History" prepared by Partners for Clean Air – Illinois (c/o Illinois EPA, www.clearntheair.org) shows that in the seven years from 2010 to 2016, the year with the highest number of Action Days was 2012 (12 days) and the year with the lowest number was 2015 (zero days). There were 12 Action Days for ozone in 2012 and 3 Action Days for Fine Particulates in 2010.

The DEIS says Fine Particulates ($PM_{2.5}$) are "unclassifiable" for the entire state of Illinois. Because Fine Particulates are a health problem, this is of concern. Based on a conversation with U.S. Environmental Protection Agency personnel, our understanding of the "unclassifiable" classification is the Cook County laboratory found that the sample filters with monitors were outside specifications. Because the U.S. EPA does not have the data to make a determination, they say Fine Particulates are "unclassifiable" for the

[6] Ibid., Page 3-124. NAAQS are the National Ambient Air Quality Standards. O_3 is ozone. $PM_{2.5}$ are Fine Particulates.

[7] Ibid., Page 3-126

[8] MSAT = Mobile Source Air Toxics, which "are a subset of the 188 air toxics defined by the CAA." CAA is the Clean Air Act.

[9] Ibid., Page 3-135

[10] Ibid., Page 3-135 to 3-136.

entire state of Illinois. The problem with the sample filters was corrected in mid-2016, but the U.S. EPA needs three years of data to compare, so they will not be able to make a determination until mid-2019. The Fine Particulate standard was last set in 2012. Because of unacceptable monitoring data, the U.S. EPA was unable to assess compliance with the 2012 standard. Standards must be reviewed every five years, so the U.S. EPA would revise the standard (if necessary) in 2017. By the time IDOT starts construction, estimated to be 2020, there may be a new Fine Particulate Standard. 13

In the DEIS, IDOT says, "*Regardless, on a regional basis, USEPA's vehicle and fuel regulations, coupled with fleet turnover, will over time cause substantial reductions that, in almost all cases, will cause region-wide MSAT levels to be substantially lower than today."*[11] Given IDOT's estimate that construction will not start earlier than 2020, updating the air quality analysis would provide better conclusions than expressed in the December 2016 Draft Environmental Impact Statement.

b. Noise Walls

Because of changes in noise wall materials, IDOT agreed to Oak Park's request to conduct another vote on whether eligible voters want or do not want noise walls. 14

c. Property Values

The evidence on the impact of expressways on property values is mixed. IDOT says its proposals "*stay within the ditch*." However, the ditch has three dimensions – width, height, and length. IDOT's proposed Build Alternatives stay within the width of the ditch in Oak Park, but do not stay within the height of the ditch at the Austin and Harlem Interchanges. 15

d. Neighborhood Impacts

What happens to property values during and after construction? Ideally, the project improves social and visual connections between South Oak Park and the rest of the Village. It should provide safe school walking routes from South Oak Park to both middle schools (Brooks and Julian) and the Oak Park River Forest High School, which are north of the expressway. 16

e. Sustainability

We are pleased IDOT used the INVEST Sustainability Scorecard in the DEIS. We note the Bronze Rating and your belief that you can achieve Platinum status during the Working Drawings and Specifications phase. 17

f. Construction Impacts

There was damage to the UIC's CUPPA building when IDOT reconstructed the Morgan Street Bridge. In Oak Park, there are many buildings close to the expressway, some of which are fragile (the Oak Park Conservatory, for example), so the effects of ground vibration are a major concern. The Citizens for Appropriate Transportation Working Group suggested four actions: (1) video / photograph documentation of building foundations, doors, and windows prior to construction, (2) an insurance rider added to 18

[11] Ibid., Page 133.

the homeowner's policy, (3) dispute resolution by binding arbitration, and (4) use construction contract retainage to settle damage claims.

Additional construction measures worth considering are the location of staging areas, possible nighttime construction, noise and air pollution, alternative routes, and staged construction. Good communication between IDOT and the communities is mandatory.

During construction, IDOT, CTA, and Oak Park should consider shuttle bus service to the Green Line Stations when Blue Line Stations are rebuilt, parking restriction changes, discount fares on the Blue Line, and improvements to local streets because traffic will be diverted to them during construction.

18

4. EVALUATION

a. Impact Scores are projections to the Year 2040

Table 1 summarizes the Number of Transportation Criteria that equal or exceed seven different percentages (50, 40, 30, 20, 10, 5, and 1). IDOT used ten transportation criteria but the Year 2040 No Build Alternative does not have managed lanes, so there are only nine criteria where it is possible to calculate the percentage improvement of the Build Alternative compared to the No Build Alternative.

TABLE 1: Number of Transportation Criteria that Equal or Exceed the Given Percentage

Amount of Improvement	GP Lane	HOV 2+	HOT 3+ (Preferred Alternative)	HOT 3+ & Toll
50%	0	0	0	1
40%	0	0	0	1
30%	1	0	0	1
20%	1	1	1	1
10%	1	1	1	2
5%	3	3	4	4
1%	4	4	4	6

19

There are only four criteria where the Preferred Alternative (HOT 3+) is better than the No Build Alternative by five percent or more. IDOT's Preferred Alternative will affect the region and the communities in the Eisenhower Corridor for the next five or six decades. IDOT's recommendation of the HOT 3+ Alternative is based on many small differences in impact scores.

Projections to the Year 2040 are unlikely to be accurate, especially given the rapid social and technological changes taking place. It concerns us that the expenditure of such a large sum will result in such a small improvement in performance.

b. The Travel Demand Models have limitations even with IDOT's enhancements.

The dollar value of travel time varies widely among drivers and depends and on how important it is to the driver to be at their destination by a given time. IDOT will have to set tolls high enough to reduce congestion. Toll levels will also have an impact on the

20

general purpose lanes as well as alternative routes on arterial and local streets. Drivers can change routes, take the Blue Line, reschedule trips, and move or change jobs. Reliability is also important. IDOT's efforts to provide real-time information to motorists will also help. Accounting for trends is difficult because they change over time. There are a wide-ranging set of possible trends listed in Table 2 to illustrate this point.

TABLE 2: Illustrative List of Possible Trends

Changes in Trip Generation Rates	Collision Avoidance Technology in Vehicles
Baby Boomers retiring and driving less	Reduction in Vehicle Miles of Travel
Recent college graduates who do not purchase a car	Growth in transit ridership, walking, and bicycling
Changes in good movement technologies	Better Parking Management
Growth in social media	Innovative car, taxi, and bicycle sharing using social networks
Real Time Information	Variable managed lanes and parking pricing policies

20

IDOT did not use the Chicago Metropolitan Agency for Planning's Go To 2040 Policy-Based Forecasts. IDOT assumes more development in the outlying suburbs, while CMAP assumes more development in existing communities. In his ruling on the proposed Illiana Expressway that remanded the Environmental Impact Statement and the Record of Decision to IDOT, Indiana Department of Transportation, and the Federal Highway Administration, Judge Alonso said, "*it would seem unwise*" to reject the Policy-Based Forecasts. By using a Market-Based Population and Employment Forecast, IDOT's Preferred Alternative could undermine CMAP Recommendations in the Go To 2040 Plan.

c. Ordinal – Ratio Scale Problem

We raised this issue in our letter to IDOT dated June 19, 2012. IDOT's response was to develop a better evaluation process using Ratio Scales. Using Ordinal Scales to evaluate the Build Alternatives and compare them to the No Build Alternative is not statistically valid. When IDOT states that both evaluation methods lead to the same Preferred Alternative, you are giving a false impression. We think IDOT should delete the Ordinal Scale evaluation and just use the Ratio Scale evaluation.

21

d. Scenario Planning

Scenario Planning considers alternative futures and their impacts. Forecasts for the Year 2040 may not be accurate. Scenario Planning would help IDOT account for different futures. Making a multi-billion dollar investment in the expressway based on future projections is risky. Forecasting is imperfect, so IDOT should analyze several different scenarios. By considering plausible scenarios, IDOT would reduce their risk.

22

e. Sensitivity Analysis

Sensitivity analysis examines the extent to which changes affect the results. Given two Build Alternatives with small differences among impact scores, the recommendation for one over the other includes language that says it would not take much change to stop recommending one alternative and start recommending the other. In contrast, given two Build Alternatives with large differences among impact scores, the recommendation

23

is much stronger because it would take a large margin of error before we would stop recommending one and start recommending the other. Small differences among alternatives for the Year 2040 reinforce the need to do Scenario Planning and Sensitivity Analysis. 23

5. CITIZEN PARTICIPATION

a. Forty-five days to write and send comments on the Draft Environmental Impact Statement is too short.

IDOT released the DEIS (with almost 400 megabytes of files) on Friday December 30, 2016. December 30 starts the 45 day Public Comment Period. Many people are busy over the New Year's weekend and will not read such a large DEIS from a study that started October 2009 and ended December 2016 (7+ years). With appendices, there are more than 2,200 pages. Within these pages are 192 figures and 78 tables. No one person has expertise in every aspect of a DEIS so people will want to talk with others before sending written comments to IDOT. 24

b. A long response time by IDOT frustrates commenters and makes them wonder if IDOT is listening.

A long response time casts serious doubt on IDOT's claim to value citizen participation. IDOT's Stakeholder Involvement Plan for Agency and Public Involvement (February 2010, Version 4) says, "*Mail and e-mail responses offer the opportunity to develop a personalized response, yet timeliness is important. The desired time-frame to develop, edit, approve and mail (or e-mail) a response is one week once it is received by the PSG."* (Page 17) NOTE: PSG = Project Study Group. 25

IDOT responded to our June 27, 2010 letter on March 18, 2011 (415 days). IDOT responded to our June 19, 2012 letter on April 26, 2013 (311 days). IDOT's shortest responses were 29 days for our November 30, 2011 letter and 30 days for our June 28, 2011 letter.

c. There was a long time between some of the Corridor Advisory Group / Task Force (CAG/TF) meetings.

There were twenty-two CAG/TF meetings. The longest time gap between meetings was 426 days and the shortest was 29 days. The gap between meetings was longer than 180 days (about six months) four times. We are aware that IDOT met with individual communities. The Task Force includes people and agencies with specific interests, concerns, and expertise, which benefited IDOT in the preparation of the DEIS. 26

d. Meaningful dialogue requires two-way communication so all participants learn from each other.

IDOT has technical expertise. Citizens know their neighborhoods and have some technical expertise as well. 27

e. Consider Creative Funding Opportunities.

Some ideas to consider are Value Capture whereby the CTA would capture some of the added value accrued to adjacent development by having a nearby CTA station. 28

Another idea is to reduce the fare on the Forest Park Branch because its ridership is lower than the O'Hare Branch of the Blue Line. 28

6. GENERAL COMMENTS

a. Coordination between IDOT and CTA must occur.

The IDOT – Village of Oak Park Letter of Intent says, "*Funding for the reconstruction of the CTA Blue Line and I-290 should be sought for both improvements as if they were one project*." Because of different priorities and funding programs, it is possible IDOT will improve the expressway years before a Blue Line extension occurs. Corridor residents and businesses may not see the full benefits for years. IDOT estimates eight years for construction, but has not decided whether to rebuild the bridges between Austin and Racine. If IDOT decides to rebuild these bridges, the construction estimate of eight years could get longer. 29

b. IDOT's Study and the CTA's Study are at different stages, so coordination between the two will be difficult.

Under Chicago Metropolitan Agency for Planning (CMAP) Go To 2040 plan, the improvements to the expressway are "*fiscally constrained*" (funds are likely to be available) and improvements to the CTA's Forest Park Branch of the Blue Line are "*fiscally unconstrained,*" (projects may by desirable and beneficial but require additional revenue). IDOT has completed the DEIS and the CTA will complete their Feasibility / Vision Study shortly. The CTA has not started to prepare an Environmental Impact Statement, although doing so is unlikely to be as complicated and time-consuming as the DEIS for the expressway. 30

c. Proofreading Errors

I did not make any effort to proofread the documents, but did notice the following errors.

- In the Table of Contents (*front_matter.pdf*) on Page iii in the Table of Contents, 3.16 says Short-**Tem** Use instead of Short-**Term** Use.
- In the Purpose and Need document (*chapter_01.pdf*), words are missing in the last sentence of the "No Build 2040" box on Page 1-4. The sentence stops in the middle.
- In the Environmental Resources, Impacts and Mitigation document *(chapter_03.pdf*), the list of parks in Oak Park on Page 3-25, does not include the Conservatory. The Conservatory has outside gardens on the east and west sides. 31
- Also in Chapter 3, Table 3-13 on Page 3-29 does not include District 97 in Oak Park. The table does list elementary and Middle School districts in other communities. The text on 3-29 says, "*Three higher educational institutions are located at the eastern end of the Project Corridor in Oak Park and Chicago*." The text mentions UIC, Rush University, and Malcolm X College all of which are in Chicago.

We have come a long way. The CTA joined the study in the Summer of 2012. IDOT extended the eastern boundary of the Study Area to Racine. The design in Oak Park 32

stays within the horizontal boundaries of the “ditch.” IDOT added a ratio-scale evaluation to help select the Preferred Alternative. IDOT incorporated recommendations from the West Central Municipal Conference Smart Corridors Study. The Village of Oak Park and IDOT have a Letter of Intent that will become an Intergovernmental Agreement later in the study. IDOT completed the INVEST Sustainability Scorecard. 32

Thanks again!

Sincerely,

Citizens for Appropriate Transportation

Paul Norrington

4247 W 21st Pl

MR. NORRINGTON: My name is Paul Norrington, 4247 West 21st Place.

I'm with the North Lawndale Community Coordinating Council. My question is employment. Will there be any job training opportunities? If not, what type of employment opportunities will be presented to our community? 1

MR. HARMET: We engage in that through the work force development staff at IDOT, and I believe we have a representative here tonight from our work force development. So I can get you connected with that person to go over the particulars with that.

PS2#1600

Thom Alcazar

2017 N. 73rd Ave. Elmwood Park, IL 60707

MR. ALCAZAR: Thom Alcazar.

And I guess my comment is I would like the Eisenhower to be built more futuristically for what we know is expected instead of just a patch job for what we know of this today. Part of that means creating what we usually create when we are building unlimited space, and that is we go up instead of just out.And when we go out, we have to acquire property. And that's expensive and usually only the insiders get to buy that ahead of time. It would be wise to consider that if you build in the conventional way where you close a lane in order to create a new lane that you are going to create more congestion. And by the time that 2-year span of development is finished, you wind up with the same congestion you were at when you started because traffic increases.

So instead, if you use the procedures we use in construction, which is add layers, you could simply double the size of the traffic capability. And you could also create a safety feature by letting the trucks use the lower level and the cars, that will mostly be self-driving by the next five years, use the upper level. So you would increase safety and you would also double your capacity. You wouldn't have to close any lanes because you could build pillars or pylons alongside the highway. You can have avoidance of the weather problems we have in construction by having the slabs that go on top of those pylons be built inside. And they could be put into place with the current technology of flying cranes that are used now to put heavy objects on top of 50-story buildings. And you would be able to only close the highway during the lowest periods of the day, which is usually a couple hours at night as you put the slabs on. 1

So it seems like using the known future as your guide instead of yesterday, 50 years ago or, no, I think it was 60 years ago when I was living alongside the Eisenhower as they were building it, only it was the Congress Expressway and we called it The Big Ditch. It screwed up our sledding when they put cars in there because we had to time it, but it was fun back then. Now it's not. Now it's a national embarrassment to go so slow at Austin and Mannheim. And even to have that slowness at 10 o'clock at night, it's just an embarrassment.

So I would suggest we kind of plan for the future. And we can do the same thing with the CTA if we put the Blue Line with a monorail above it, the monorail would be for the express to the suburbs and then the lower one would be for the Chicago traffic. And then you would have a lessening of -- Well, actually you might have a lessening. But there is going to be so many people wanting to ride it you would have increased ridership, so that would be a simple common current technology process also.

As far as a real headache that drives me crazy, only because I have a modicum of common sense, when I see the ventriculated bus by CTA, that's the double length ones that are the most expensive to maintain and fuel, when I see those going at 11 o'clock at night with 3 riders on the entire route, I wonder if there is someone at CTA thinking. Because there would be a more cost effective way to utilize that bus and a more cost effective way to handle those three passengers. So that's mostly -- 2

Oh, also, please tell the CTA that when they use their GPSs and they have got a full bus and an empty one behind, the whole dispatching system for CPA is designed to let the empty bus go ahead instead of staying behind. That would be a nice thing for the customers. 2

Thank you.

MR. HARMET: So in terms of double-decking the Eisenhower, you have to think about how it's built today. It's got overhead bridges. So then we have to go over the overhead bridges. So you would have a road that is another maybe 30 feet up in the air. And it would all be a bridge. And bridge, bridges are dramatically more expensive than pavement. So even if the design could be worked out and it would be way up in the air, it would be much more expensive. I would say that HOT lanes, these managed lanes, are the 21st Century thing across the country. So that is something modern.

In terms of self-driving cars, we don't know at this point what that impact will be on transportation. We are certainly going to keep looking at it, what the impact would be, and when that impact would occur.

How, how soon would the entire vehicle fleet turn over. Those are questions that are still being debated nationally. But certainly we will take a look at that. In regards to double-decking the Eisenhower, certainly they have got to do a very careful and detailed plan with construction.

MS. FARZIN: For the CTA, I think that my comments about the extension that we made before, that we need to maintain the existing infracture. We have over 20 percent of the branches out there today have slow zones on it. So we need to bring that current infrastructure up to design speeds before we would consider what we would, what we may want to do for an extension in the future.

As far as the CTA service planning comments with buses, I know there are planners here.And I appreciate you giving those comments in a public forum because it will be heard by the planning staff, and we will have an opportunity take those back.

Thank you.

MR. ALCAZAR: I have a question on that. Why are nine of the Blue Line stops closed in the poorest section of the city where they most need jobs? 3

MS. FARZIN: There, as far as I know, there are eight CTA entrances that have been closed along the Blue Line over the years. Over 45 years ago, three stations were closed, California, Kostner, and Central. And two station entrances were closed in the '80s, that's Keeler and Lavergne, and Cicero and Pulaski stations.

And our current recommendations are to reopen the auxiliary entrances at Pulaski and Cicero and Keeler and Lavergne. The auxiliary entrance at Keeler would help serve the market at Kostner. It's only one block to Keeler to Kostner, so that market.

And as far as the other locations go, the CTA has recently had some very successful infill stations. The Morgan station on the Green line is one and Cermak as well.

And we, after those successes, we have kind of instituted an initiative in the department to consider looking at infill stations across our entire system because there are many opportunities. And those locations on the Blue Line are being considered, as well as locations systemwide on all of our branches, to find the best opportunities for infill stations going forward. And we will continue to do infill stations. We have had success with that and as money becomes available, we will have a program to continue to advance with those.

MALE VOICE: What kind of stations did you say? I couldn't understand you.

MS. FARZIN: Infill stations. A station that is in between two existing stations. So where there is no station now but between two existing stations. We have had some recent success with opening new stations on existing lines. And we are going to continue to look at opportunities systemwide to do that going forward.

PS2#1606

Thom Alcazar

2017 N. 73rd Ave. Elmwood Park, IL 60707

MR. ALCAZAR: Thom Alcazar, 2017 North 73rd Avenue, Elmwood Park.

I would like them on the Eisenhower corridor to consider the future instead of just the patchwork for today. That means including a knowledge about current technology. What happens generally when you build something that's being replaced after 50 or 100 years, like we are doing now, is you look at the fact that traffic patterns have changed, quantity has changed. And you look at what the impact will be in building the change. Building this change would require them to close a lane in order to build a lane; that means traffic will get worse before it gets better.

Time frame for when it gets better is possibly two years after the building starts. And by then, the traffic patterns will have increased to such a point where we would be right back at the current congestion level that we have today, which means that we will accomplish absolutely nothing but create inconvenience for the two years during the building. 1

The only intelligent and logical thing to do is to build highways today anticipating that most cars will be able to be driverless and most cars will have a better safety feature by separating them from heavy trucks. So in order to avoid the fact that we have weather in Chicago and that that weather adds a disproportionate cost to building highways; that the way this highway should be built is to simple build pylons along the existing structure, like pillars, and concrete slabs to be built indoors so that they could be built to specification and serialized so we know which ones are going to be most efficient, and that we could draw back money from the companies that produce inefficient products that don't meet specifications based on their deposits, bonds. So once these slabs are built, which can be built in multiple manufacturing sites all over, they can be flown into position by flying cranes. And there would have been no traffic disruption, and we will doubled our capacity. So the ability then to separate the cars from the trucks, the ability to double the capacity instead of simply adding a lane with all the inconvenience and weather problems seems like a logical and easy solution.

If we decided, in fact, to build for the future. Along with that build, if we were coordinating with CTA, we would add another level above the current Blue Line, which would be a uni-rail. That uni-rail would actually reduce the amount of traffic on the lower LTA line or the Blue Line because it would be an express train, so that it actually would have no stops until it hit the suburbs. So that would reduce the traffic for all the Chicago area, and it would speed traffic to the suburban areas; so we would wind up with a benefit in both directions. Uni-rails have become the world's most efficient way of travel. So to continue to build old-fashioned technology in both the CTA and highways seems like a ridiculous, backwards step that is only a patchwork. 2

Lastly, I would like to know if the materials used for this, what I consider a very poor plan, are expected to be either cement, concrete, or if they are, in fact, going to use asphalt. Obviously, if they use asphalt, it's being done as a make-work project since asphalt only lasts 7 years and requires annual maintenance for all the cracks and holes that it develops; where concrete lasts 30 years and would actually result in one quarter of the cost. So that's my suggestion and claim to fame. 3

One thing I would like to add. I would like to admit that I know one of the bars against my proposal is when you have to buy additional land and do an acquisition the insiders have already purchased it. So if they use my idea, those people wouldn't get the benefit of their bargain. 4

PS2#1609

Thom Alcazar

2017 N. 73rd Ave. Elmwood Park, IL 60707

MR. ALCAZAR: Thom Alcazar, 2017 North 73rd Avenue, Elmwood Park, Illinois 60707.

I have extensive experience riding public transportation from having lived in downtown Chicago across from Grant Park, from having worked in West Chicago, near West Chicago, and from now living in the suburbs, and I would say that my first comment would be that after over 20 years having GPS, CTA should learn to use it. It's inexcusably incompetent to have a full bus with an empty bus behind it and not have enough sense to have the empty bus pass the full bus to alleviate some of the traffic. It's inexcusably incompetent to have up to three or four buses idling when it comes to where the buses stop and end. If those buses are all available idling, they should be redirected to a route that has people waiting.That's what GPS is designed to do with very simple dispatch systems that have been around for over 20 years. Not knowing how to use GPS tracking is incompetent and embarrassing and inconvenient. 1

When it comes to the corridor of the Blue Line, it is unconscionably unpleasant and inexcusable to have nine closed stations along the Eisenhower and even along the Green Line only in the areas of the city that have the most poverty and the least access to private vehicle ownership. To have those people imprisoned because CTA has decided to close what was previously open access to the Blue Line, I think is criminal. These are people who we would like to have getting jobs who can't walk four or five blocks through gang-infested territories, going through two or three different gang territories in order to get to a stop during icy weather, snowy weather and extra hot weather and expect them to get jobs at UIC, O'Hare and other places that could be hiring them. I think CTA is complicit in creating a low-security prison for these impoverished territories. And if they would simply take their plans for the Eisenhower corridor and use current technology that already anticipates the future and put another line above the current line, make it a uni-rail line which is more cost effective and is considered the current cost-effective technology and make that uni-rail line an express line to the suburbs, that will make better ridership for all the suburban people that would enjoy that kind of service and utilize it and it would also make improved ridership with the city transportation because it wouldn't be as crowded with all the suburbanites. 2

The most expensive and costly buses that we have and operate and maintain are the ventriculated buses. Those buses are being utilized at midnight with three or four passengers on the entire route. That is unconscionable. A shuttle bus would be sufficient than use the most expensive bus. Has to have been an idea made by an idiot. Shoot yourself. 3

I have a multi-point blueprint for the Eisenhower from the 88-294 junction through to Congress:(1) Create a bidirectional expresslane with dynamic tolling that will levy an extra variable fee (depending on congestion) for inbound and outbound traffic. This will reduce congestion and generate revenue for the project. No one will need to pay the toll unless they opt for the expresslane. Assume the expressway handles 200,000 cars per day and only 10% of those cars opt for the expresslane. Assume also that the toll charge for the lane amounts to $5. The toll will generate $36.5 million annually in revenue.(2) Depending on need, convert the blueline that runs along the Eisenhower into a below grade subway. This will provide space for extra lanes depending on long-term need.(3) If the blueline is made a subway, consider extending the line further west and adding express or non-stop service with park and ride locations. Express service could terminate at the Block 37 station. Added service may also generate new revenues, which could be used to finance the project. Added express service will also reduce congestion.

I'm strongly opposed to HOT or HOV lanes. Either make it a tollway or don't. All the lanes should be interchangeable as to make sure there are never half of the lanes that are moving at different speeds. Splitting it by two lanes for general use and toll would be extremely undesirable for when I'm in that area. All lanes are needed to overtake slower vehicles as on the Tri-State where it is flawless in execution. I'm rather even have express/local lanes, but absolutely not HOV that is more about trying to altering driving behavior than expanding on capacity that is sorely needed. 4 lanes for everyone to use at their convenience once they're on 290 would be strongly preferred. Also 2 full shoulders is massively important as well, even considering the confines of the right of way 1 2

Instead of focusing on a freeway that has four lanes and is at 38% capacity. Attention should be focused on the Stevenson expressway with its 3 lanes serving all the southwest suburbs and the preferred freeway for freight movement in the city which has bottlenecks at each on ramp. All that space in the median and the state wanted a bus lane now they want a toll lane. How about just adding a lane, and a carpool lane like all other major cities have figured out. Illinois is dropping the ball on this freeway, needs to be updated to accommodate today's freight and traffic needs 1

This is utter and completely wrong. Why should the Eisenhower be turned into a toll road even if partially? The Dan Ryan underwent construction and no tolls were enforced. The city should be responsible for funding the construction. We taxpayers are overburdened and can't afford any more increases, let alone to necessary roads and expressways. The city/state need to find a different solution. 1 2

I agree that this corridor should be upgrade however, and let me be clear about this, I am absolutely and adamantly opposed to any kind of toll or tax increase of any size. You already have more than enough tax revenue so you may have to make very hard and very difficult decisions to pay for this. Live within your means! Do not attempt to raise taxes or add or increase tolls. NO!! 1

Once again, IDOT and the Tollway trying to squeeze more money out of DuPage County and the residents that commute every day into the City. It's bad enough that we already pay an unfair share of RTA tax to subsidize the CTA and other services. These lanes will only push more commuters onto I-55 and the already swamped Metra system. My recommendation would be to extend the CTA blue line into DuPage County and offer more transportation options rather than trying to put a Band-Aid on the Ike. 1 2

Eisenhower expressway

Comment Form
Public Hearing

Illinois Department of Transportation

Please select date: [X] *January 25, 2017* [ ] *January 26, 2017* [ ] *I was unable to attend*

The Illinois Department of Transportation (IDOT) is holding public hearings on the Eisenhower Expressway Draft Environmental Impact Statement (DEIS), which is evaluating transportation improvements on Interstate 290 in Cook County, Illinois. The DEIS evaluates the section of Interstate 290 from west of Mannheim Road to Racine Avenue. The DEIS is a compilation of stakeholder outreach and comprehensive information about the project's purpose and need, alternatives under consideration, the preferred alternative, social, economic, and environmental effects and proposed mitigation strategies, and potential effects on future traffic operations. The findings of the CTA's Blue Line Vision Study will also be presented.

Public comments will be accepted through Monday, February 13, 2017. Please place your comment forms in the box marked COMMENTS; **or** fold in thirds, tape closed, place a stamp and mail; **or** fax to (847) 705-4159. Comments can also be submitted on the project website at www.EisenhowerExpressway.com.

The public is encouraged to review and comment on the:

- **Project's purpose and need for the improvement**
- **Alternatives under consideration**
- **Preferred Alternative**
- **Preliminary road closure plan for Harrison Street and Bataan Drive at 1st Avenue**
- **Social, economic, and environmental effects and proposed mitigation strategies**
- **Proposed Section 4(f) *de minimis* impacts for improvements at public parks (Veterans Park, the Dog Park, and the proposed Recreation Center site along Circle Avenue) in the Village of Forest Park**

IN THE FILM PRESENTATION, IT IS MENTIONED THAT THERE ARE PLANNED IMPROVEMENTS TO NORTHAVE (THANK YOU!) 22ND ST & MADISON AVE.

HOW DO THE IMPROVEMENTS TO MADISON AVE COORDINATE WITH DOT PARKS PLAN TO REDUCE THE LANES FROM 4 TO 2? 1

(DOES THE RIGHT HAND KNOW WHAT THE LEFT HAND IS DOING?)

I am strongly opposed to the proposal of installing sound walls along the 390-corridor through Oak Park. I have not seen evidence that the technology will have an impact that is commensurate with the investment. Additionally, I think they are often ugly and are likely to diminish the property value while also acting as a visual divider for our community. 1

*Lombard Bridge: The bridge will be 1 foot lower. Currently, the Sight Lines in this area are obstructed by concrete walls combined with the sharp angle of the bridge merging into Garfield. Drivers make wide turns because of the lack of good Site Lines. The bridge acts as a walk way for Irving Elementary School children from their homes to school; the area is located by a park and community center with children drop off areas; and the Lombard CTA access point is located here. Since the bridge is IDOTs responsibility wrt building and design, the site lines and pedestrian traffic (specifically for small children) needs to be improved. Additionally, a Divvy bike station is located here. Many bicyclists cross at this bridge (since Ridgeland is a very busy street). Children ride their bikes over this bridge to their school friends located on the other side of the highway and to baseball and soccer games that occur at Barrie Park. A bike lane should be added to this bridge to assist with cyclist safety. Please note I know individuals who have been hit by cars multiple times at this intersection. It is not currently safe and the design needs to greatly improved. Please consider adding speed tables or rumble strips prior to pedestrian walk ways to decrease driver speed.** 2

Adding additional lanes seems unnecessary and will serve only to increase traffic. While academic studies about induced demand haven't proved definitively that highways generate brand new traffic, there is absolutely plentiful data showing that the addition of new highway roadway diverts people from other time and other modes of transportation--and that not too long after the expansion is completed, the highway will be just as congested as it was before. In light of this, it would be irresponsible and short-sighted--and, frankly, a waste of taxpayer money--to expand the highway. 1

This project seems to me another classic case of induced demand. ?Widening I-290, even if motivated by the concern over traffic, will do nothing to reduce it. According to history and research, it will only increase traffic. Adding lanes on I-290 is effectively a waste of taxpayer money. The argument that this "expansion" will provide net economic benefits and roadway capacity, thereby reducing congestion is ignoring traffic and induced travel impacts, changes in trip frequency and destination, incremental costs of induced travel and traffic (congestion, road and parking costs, accident, pollution emissions...), increased vehicle miles. This project seems it will be economically inefficient. 1 2 3

I can’t believe we're even talking about adding lanes. We know it doesn’t do anything to alleviate traffic. We need to invest in transit. 1

PS2#1621

Steve Bahnsen

2921 S. Michigan Ave. Apt 404 Chicago, IL 60616

MR. BAHNSEN: My name is Steve Bahnsen. I live at 2921 Michigan Avenue in Chicago.

Three questions have come up during this and what I'm asking now. What other project is this competing for funding that you have in district one of this scope? What will the times be when the HOV lanes are used? I mean just rush hours, or all the time? Or some places you can drive in them on Sunday even if there is only one person in the car. 1 2

And then do you anticipate the state police enforcing this rule that there is two or three people in a car? If not, is there another way you envision this being done? I would think they would have other priorities in a city where 762 people were murdered last year than driving around and seeing how many people are in a car. 3

MR. HARMET: We don't view this as competing with other projects in the region. This is the biggest project in the region right now. And so there is not sufficient funding to pursue building this project, that's what we know. But we do planning in anticipation of funding. We won't be able to really get to the funding issue or even how much funding is needed until we are able to work together to figure out what the concept is. So this is a very important first step.

The HOT Lane, High Occupancy Toll Lane, we have come up with some toll rates at a conceptual level. But there is more work to be done in the next phase of project development. At the low end it would be 12 cents a mile, and then at more congested times of the day it would be 24 cents a mile. And so whether or not it's in operation overnight as well, those are all things that haven't been decided, that's more analysis needs to be done. But the way it would work, the way we have analyzed it is if you are a car pooler you would ride in that periphery; if you were a transit vehicle, you would ride for free. And all others could ride in it but would pay a toll. So it has a mix of users in it.

In terms of enforcement again, we will look at the best practices across the country, if there is technology, electronic things. I know in other states they have, you preregister as a car pooler. And so before you are even in the lane you have got in the database. Other states have transponders so that have a switch where if you are a car pooler or not so it's reading that.

And then, perhaps, there is some sort of detection technology. But those are all things that are yet to be analyzed, that will be the next phase of project development. And again we will look at everyone else's best practices for that.

Charles Banks

1003 S. Ridgeland, Oak Park, IL

MR. BANKS: Charles Banks, 1003 South Ridgeland, Oak Park.

You answered part of my question concerning the bridge, bridgework that's going to be done. But being somewhat selfish from Oak Park, I'm still curious about the cost and what is actually going to happen. Because again, you have to widen the footprint a little bit and every bridge in Oak Park has got to be redone. The bridge ability to cross the expressway has to be redone. 1

Then as I become less selfish and go all the way down to Racine, you have got a ton of bridges all the way that have to be done. Is all that cost still figured in the 2.7 million.

MR. HARMET: Yes.

MR. BANKS: That seems short. 2

MR. HARMET: There is a lot you can do with $2.7 million.

MR. BANKS: But given the bridgework that needs to be done, you are going to be rebuilding completely practically every bridge along the way. 2

Okay.

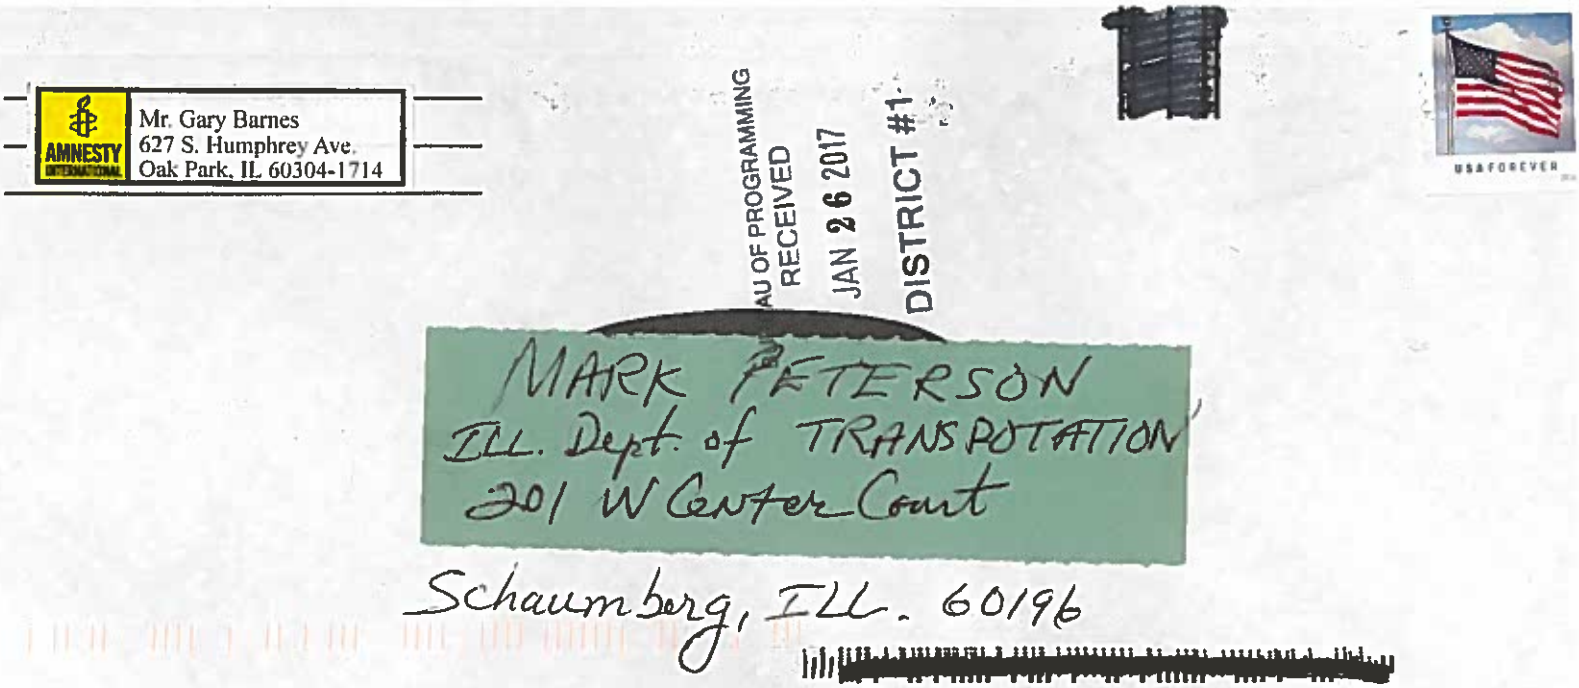
MR. HARMET: The answer is yes.

JAN 21, '17

Dear Mark Peterson — I expect to be in Forest Park Wednesday, JAN 25 (regarding I-88 expansion hearing) and hope you will address what I'm getting at here.

I always visualize roughly the same 3 problems with your work. They are Noise, Safety and Climate change: All three are serious objections: Things which are under control will get worse if you add 2 more lanes. 1

Then there's the astonishing amount of money. Illinois needs to spend that on public and higher education. 2



Lastly there's the question of urban sprawl (not sure if that's the best phrase). Promoting driving is bad in and of itself (very risky) and the speeding which is a direct result doesn't seem to be deterred by police anymore. I live less than a half-mile from the Austin entrance and prefer city streets: It's been at least 10 years since I drove on the I-88 and ~~[illegible]~~ went with other drivers twice and felt quite frightened that they felt forced to drive as fast as they did. 3

In addition, the need to get away from the Loop should make Oak Park attractive. What you're proposing if I grasp it accurately, will turn Oak Park — formerly a place to stop and shop — into a blur. 4

Please emphasize the need to solve these (several) problems instead of accentuating them. I've been looking for commonsense for about 10 years, still looking.

Hope my writing is ok.

MR. BARNES: Gary Barnes is my name.

I really have a sort of simple point, a little simpler than the letter I wrote, which is that I'm not much of a speaker anyways; so the ancient thing for doctors when they got endowed and moved into practice was First do no harm. I couldn't find the Greek name in my book so --

And the three things that I have in mind are three things that I think have been taken fairly well care of. The first is the damage, damage to people. People are slowing, will slow down there and continue to slow down just out of practice if we don't do this. And if we do it, it's just the opposite; so we are doing harm if we do that. Because we really have lots of --I haven't, I have been half a mile from that entrance to the Ike for --Well, I haven't been on it for at least ten years. It's just too dangerous. I have been on it with a couple of other drivers, I just felt too dangerous. So to make it faster is my definition of a way of making it more dangerous, and that's the harm that we are doing with all that. We already have way too much damage to the people in our cars. 1

The second thing is the noise thing, of which quite a bit of effort has been made talking about that in Oak Park because there are so many people living and sleeping and everything so close to the road there. Same thing, more, more speed, more noise. 2

And the third thing is climate change. Again, we are really without any doubt doing damage. I have been saying this for

30 years, or I have been an activist for at least 20 years that I can remember. And just nobody says we need more driving or faster driving. Everybody says we need less. So this is we are doing damage when we don't have to do it. 3

Do I have to mention that Springfield doesn't have any money, or so they are always saying? Crazy. 4

Speaking selfishly now for Oak Park. Oak Park loses if everybody just goes flying through. It's like they don't know we are there. They might be able to pull off and shop there or something like that, which isn't a personal interest to me. But I do think, it's a nice town. Some people like to drive through it, but they are going to have to not do that if this gets any faster down there. It's just too crazy. That's pretty much what I have to say. 5

PS2#1603

MS. BATIE-BANKS: Ethel Batie-Banks, 333 South Washtenaw, Chicago, 60612.

I enjoy all of the improvements that I see. 99.9 percent of them are much wanted and needed. The problem is the issue of the wall. The wall will cut a community in half. I'll never see my neighbors on the other side of the expressway. I'll never see the functions on the other side of the expressway. I won't see the traffic flow that I'm used to seeing. I have been living in my house for 25 years. I have lived in the neighborhood all my life, and I believe the wall is just a negative influence. It's supposed to be 17 feet tall and that means that it's going to stand like a 2-story building blocking all views.

Also, the wall will attract graffiti. It will give a hiding place, you know, duck around corners to hide behind a wall when unsavory activity occurs. It's not going to block any noise because noise is a part of living in Chicago. The wall will remind me daily of the wall that's around Cook County Jail and I don't want to feel like I'm in a jail. 1

It's going to reduce property value, no matter when it goes up, it's going to start reducing the property value and even though it's ten years down the road, that's when we can expect the wall to start deteriorating the west side of Chicago.

True, Chicago's west side is now on its way up. It's going to take a deep nose dive as soon as that wall goes up. And that's how I feel about it.

Sent: Wednesday, February 08, 2017 4:24 PM
To: Harmet, Pete E
Subject: [External] Eisenhower expansion

I am writing in response to IDOT's draft environmental statement. I live half a block from I-290, and I commute to work every day on the Blue Line. My husband drives to work on the Eisenhower, so we are a multi-modal family and appreciate both transportation options.
It is a mistake not to extend the Blue Line at least to 1st Avenue as part of the expansion of the Ike. More riders will mean fewer drivers, so when the expressway is expanded, cars will actually move faster (rather than increase in number to fill the extra space, as they did after the Hillside Strangler expansion). Expansion alone won't solve the congestion problem. 1
I also urge IDOT to consider helping to figure out how to make it possible for commuters to safely bicycle from the near western suburbs (where the Prairie Path ends) to the city. This would not only reduce congestion further, but also improve the quality of life for bike commuters. 2
Best,
Sharon Bloyd-Peshkin

MR. BRANDSTRADER: Fred Brandstrader, 1046 South Scoville in Oak Park.

A quick budget question, four-parter. Is the prep work, the advance work for the ancillary roads, included in that $2.7 billion number? And if not, what is that estimated dollar amount for the prep work, and is it funded? And then the last question was what is the budget for the CTA work. 1 2 3

MR. HARMET: For the advance work on the arterials, we are actually engaging in planning on that right now. So we will develop a cost at the end of that planning so that's not included in the 2.7 billion.

And Janine will answer the question about CTA.

MS. FARZIN: Sure. For the Vision Study, we have a cost estimate of $1.7 billion in current year dollars. We don't have a construction phasing plan, so we don't know which years those would be applied to, that includes modernization and accessibility improvements at all the stations of the branch. A new Forest Park terminal yard and shops and a maintenance facility and terminal at the end and the track work, excuse me, which is our first element. The construction of the core infrastructure, which is like all the ballast and tracking.

MR. BRANDSTRADER: That's current dollars, the 2.7 is current as well? 4

MR. HARMET: 2.7 on the roadway side is future dollars. The midpoint of an 8-year construction schedule.

PS2#1626

Feb. 12, 2017
Illinois Department of Transportation
c/o Mr. Peter Hamet and Mr. Mark Peterson
201 West Center Court
Schaumburg, IL 60196

Dear Mr. Hamet and Mr. Peterson:

I am writing you today to avail myself of the opportunity to comment on the Draft Environmental Impact Statement(DEIS) on reconstruction of the I-290 corridor.

It is an immense project and your lengthy DEIS reflects that size. Please extend the public comment period. Forty-five days is a relatively short period of time to comment on this 2200 page document. 1

I would urge you to put reduction of congestion at the top of priorities for this project. Presumably, the rebuild of the expressway is necessary, given deterioration of bridges, ramps and the roadbed itself. This we can accept as a necessary fact of life. With the hindsight of decades of experience, the design of the expressway itself can be improved for the sake of safety and to better integrate it into its surrounding communities. But to rebuild it and to not substantially reduce congestion in the roadway would be a misuse of taxpayer dollars. The notion that congestion would be reduced from the current levels of 17 hours a day by less than an hour to 16.25 hours (in IDOT's best case scenario) is laughable in its insufficiency. 2

Reduction of congestion is necessary to reduce air and noise pollution. It is also necessary to maintaining an economically efficient infrastructure for our region. To accomplish this we need better coordination between IDOT and the CTA. Extension and improvement of the west branch of the CTA Blue Line is absolutely essential to the success of the rebuild of the corridor. In fact, our Village of Oak Park has already urged that funding of improvements to the two modes of transportation should be made in tandem.

I know that IDOT's focus has traditionally been on highway systems, but there are compelling reasons for tying an extension of the Blue Line and rebuild of the expressway together. Remember the huge amounts of money spent to "fix" the Hillside Strangler? Drivers along this stretch of I-290 have seen precious little relief from congestion there. Perhaps enhanced public transit would have helped. 3

Air quality is greatly influenced by congestion. You want to reduce emissions? Do something to reduce the amount of time we sit in traffic. 4

Ridership on the Blue Line continues to grow, despite the fact that service has been hampered by poor track repair and frequent slowdowns. Better service will encourage even more ridership. 5

Admittedly, the impact of public transportation on traffic congestion is difficult to quantify. Simply comparing public transportation ridership figures with expressway usage is insufficient. Recent research (August 2013) by Michael Anderson of the University of California at Berkeley and the National Bureau of Economic Research, indicates that the impact of public transportation is far greater than ridership figures would indicate. Analysis of actual delays incurred during a transit workers strike in Los Angeles in 2003 revealed increases of 47% in delays in expressway commutes, despite only about one percent of commuters in the L.A. area using the transit system. The reason for the disproportionate impact was that, like the Blue Line, the LA transit system ran parallel to expressways and carried workers who would face the worst congestion. Other recent studies of transit in many U.S. cities indicates that transit construction has slowed the increase of congestion in many U.S. cities. 6

Also of concern, again because of potential congestion, is the idea of expanding the number of lanes by including substandard eleven-foot-wide lanes. I fear this could be self defeating, as narrower lanes would create more of an accident hazard, that would in turn result in more accidents and thereby more slow downs as a result of the infamous "gapers gap." 7

Finally, I would like to comment on transit related development. In recent years we have seen surges in development, primarily of housing, near mass transit stations, both in the suburbs and city. Although economic development is not the charge of IDOT, it wouldn't hurt for IDOT to be sensitive to the positive ramifications of transit related development in the communities of Forest Park, Maywood and Bellwood. This is truly a case of "build it and they will come." 8

Thank you for your hard work and for the opportunity to comment.

Sincerely,

Nick Bridge
Oak Park

PS2#1623

Hello, the following are my personal comments on the IDOT Eisenhower Expressway Draft Environmental Impact Statement (DEIS). Rebuilding the Eisenhower Expressway is a long overdue and much needed project to accommodate transport demands of Chicago and the Western Suburbs in the 21st Century. However, it is the generally incremental approach to this once in a lifetime opportunity that is a potential shortcoming.

The prime problem with the DEIS is continued overwhelming reliance on single occupant transport as the long term solution to congestion and pollution problems. The implementation of High Occupancy Vehicle (HOV) lanes as well as bus dedicated lanes have been demonstrated to be marginal at best, even under heavily controlled conditions as articles like the following illustrate: http://www.accessmagazine.org/articles/spring-1995/are-hov-lanes-really-better/-- . The tendency has been that even with incremental improvements, such as what is proposed, additional traffic taking advantage will overwhelm capacity and bring about a return to congestion after a brief "honeymoon". The HOV line should be considered more of a transit lane, with buses and occupancy by 3 or 4 occupant vehicles, not just 2, as a standard. 1

Giving non-vehicle options remains a better way to keep cars off the road in areas that have sufficient density, which the Western Suburbs has. Therefore, a re-emphasis on expanding the CTA Blue Line to Mannheim Road, if not, Oak Brook, should be placed back on consideration and construction be planned for after the southern extension of the Red Line is underway or complete. 2

My second comment is peripheral to transportation issues, but an opportunity to contribute to clean power. Sound barriers are being proposed for up to 12 miles of the Eisenhower from Ashland Avenue to Wolf Road. The northern side of the Eisenhower can have solar photovoltaic arrays added or substituted for portions that would be at minimal risk of vandalism or theft, and be built at minimal incremental cost. Every mile of a solar powered barrier can generate clean electricity for the equivalent of up to half a megawatt of capacity and be financed through the Future Energy Jobs Bill legislation recently signed into law. 3

It is understood that IDOT has to be stewards of tax dollars for infrastructure, but as important, if not more so to not be so conservative or incremental that a project is obsolete or of insufficient capacity as soon or even before it is completed.

Will the stairs at the Lombard CTA entrance be replaced with a ramp? This would be a welcome improvement, as those stairs are very challenging if not impossible for many people to climb. When I was pregnant I had to sit halfway through. I've seen elderly people have much difficulty, not to mention it's impossible for anyone in wheel chair, yet that entrance is better to drop off anyone physically challenged vs the Austin entrance. 1 What is the status of the wall? 2 Hoping improvements being considered for Roosevelt and Madison will come to fruition. Cermack is not a viable alternative route for anyone in Oak Park during construction on 290. North Ave is also not realistic, most folks in Oak Park would take Lake Street. 3 Garfield between Lombard and Ridgeland, particularly coming out of the Highland alley (west side) is notorious for poor vision lines. Many accidents arise due to cars parked on Garfield and also trees planted in spots that block vision lines. Will this be addressed? 4 I'm also very concerned about the Lombard Bridge being lowered. Currently, the Sight Lines in this area are obstructed by concrete walls combined with the sharp angle of the bridge merging into Garfield. Drivers make wide turns because of the lack of good Site Lines. The bridge acts as a walk way for Irving Elementary School children from their homes to school; the area is located by a park and community center with children drop off areas; and the Lombard CTA access point is located here. Since the bridge is IDOTs responsibility wrt building and design, the site lines and pedestrian traffic (specifically for small children) needs to be improved. Additionally, a Divvy bike station is located here. Many bicyclists cross at this bridge (since Ridgeland is a very busy street). Children ride their bikes over this bridge to their school friends located on the other side of the highway and to baseball and soccer games that occur at Barrie Park. A bike lane should be added to this bridge to assist with cyclist safety. Please note I know individuals who have been hit by cars multiple times at this intersection. It is not currently safe and the design needs to greatly improved. Please consider adding speed tables or rumble strips prior to pedestrian walk ways to decrease driver speed. 5

Eisenhower expressway

Comment Form
Public Hearing

Illinois Department of Transportation

Please select date: [X] *January 25, 2017* [ ] *January 26, 2017* [ ] *I was unable to attend*

The Illinois Department of Transportation (IDOT) is holding public hearings on the Eisenhower Expressway Draft Environmental Impact Statement (DEIS), which is evaluating transportation improvements on Interstate 290 in Cook County, Illinois. The DEIS evaluates the section of Interstate 290 from west of Mannheim Road to Racine Avenue. The DEIS is a compilation of stakeholder outreach and comprehensive information about the project's purpose and need, alternatives under consideration, the preferred alternative, social, economic, and environmental effects and proposed mitigation strategies, and potential effects on future traffic operations. The findings of the CTA's Blue Line Vision Study will also be presented.

Public comments will be accepted through Monday, February 13, 2017. Please place your comment forms in the box marked COMMENTS; **or** fold in thirds, tape closed, place a stamp and mail; **or** fax to (847) 705-4159. Comments can also be submitted on the project website at www.EisenhowerExpressway.com.

The public is encouraged to review and comment on the:

- **Project's purpose and need for the improvement**
- **Alternatives under consideration**
- **Preferred Alternative**
- **Preliminary road closure plan for Harrison Street and Bataan Drive at 1st Avenue**
- **Social, economic, and environmental effects and proposed mitigation strategies**
- **Proposed Section 4(f) *de minimis* impacts for improvements at public parks (Veterans Park, the Dog Park, and the proposed Recreation Center site along Circle Avenue) in the Village of Forest Park**

Consider this for "C1" OTHER Alternatives on the EIS

This is a concept to BYPASS the Congress IKE, removing some of its traffic and getting it headed to where its going Rail yards and truck terminals around Cicero to I-55 It would be built over existing rail ROW mostly. Estimate 100 to 200 homes/business properties affected 1

Have a feeling after ALL is said & done with this ~~I-290~~ project, NOTHING WILL CHANGE. 2

This Hypotenuse project is the only thing that will solve many Chicago traffic problems. Complete Cook county's SECOND TOLLWAY 1

STRANGLER CONNECTION / FLYOVER

NEW BRIDGE
OVER SanShip
Cicero to Pulaski

Heres the MAP http://imgur.com/u9L0fFx OR this even? http://imgur.com/E6RD2Co

The major traffic problems weve faced in Chicago and Cook County for the past FIFTY+ years dont seem to be getting resolved anytime soon. I believe a HUGE part of that is the lack of "Hypotenuse", a sixteen mile, what surely will have to be a Tollway now, between the #1 clusterF in the country, the Hillside Strangler and the Skyway split in Englewood. The only route at present, is going down the Ike, through Bymecircle, then down the north part of the Ryan. A 22-mile trek that, while "free", is hardly that when the sun is up anyway. So building the Hypo would cut six miles off that trip. But, theres a FOUR mile FREE bonus!! It would shorten a drive from Schaumburg to Gary, presently 60+ miles, to FIFTY because it eliminates the "curvature" of the Kennedy or the Tri-state. amazingly making Indianapolis and Madison ten miles closer, even Seattle and Boston. Interstate traffic would appreciate an option to Chicagos forever crowded "freeways". THE Hypo is more like five or six. The Ike and N Ryan is one. US 12 & 20 is another. I-55 & Cicero to the Skyway split, too. Any surface street within a mile or two really. And an improved rail corridor?

The "problem" actually started in the 1850s, with the explosion of Chicagos population from a dot on the map to one of the fastest growing cities on the planet for decades and the numerous RRs terminating/originating here, mostly on the southside. Then the Civil War, that FIRE, two world wars, Chicagos illustrious history. How could planning ever be properly done? South Chicago Ave and present day Skyway and old IC (now CN) and NS RRs started to get the SE-NW thing going, but there was never really any plan to continue on that vector. Maybe the ill-fated Crosstown (I-494)? The south part made some sense, NO way the north. Ideally, US 12 & 20 should have taken a diagonal through town instead of the long, present-day EW-NS path.

Of course, youve read the Kennedy (Is 90/94) is the #1 Interstate mess in the country. Its time for I-90 to move out. Its been eating the groceries and not paying the rent for 38? years now. And before that, it was on the Ike. You can see it from space, its as plain as the nose on your face. No more 90/94.

Heres some distance calculations and shots of what it might look like.

https://imgur.com/CwPU7Ox https://imgur.com/IAt9KVf

https://imgur.com/gallery/ulBjx/new

Texas A&M Transport Institute estimates congestion costs us over $7B per year around here in lost productivity and "diminished quality of life". Yeah? Add increased pollution, lack of business creation and retention, smaller tax base, underfunded schools, no jobs, crime and gun violence, then becoming the media "poster-child" for all of that...$7B sounds low.

Whats missing??

https://www.google.com/maps/@41.8337329,-87.7319639,11z

Have some fun. Click above, go to satellite, zoom in and follow the route. From the Strangler, follow CN rail SE to Berwyn, over Cicero Av. crossing the SanShip Canal, I-55, and Pulaski, along BNSFs Corwith railyard, then east along 49th. Over Western, turning south along CSXs railyard. Then a turn east at the ROW north of 59th. Follow from Damen to Halsted, then turn SE follow till ya cross the Ryan, adjacent to the NS tracks and merge into the Skyway. Thats it!

Connecting ramps/work zone
At Strangler: WB to 290 (or the "new" I-90), N294, 88. Really liking the flyover I-294 idea, that would include a ramp from E88 & N294 and get rid of the slow oval ramp. EB from 290 & 88 (294 already merged). Work Zone 1
Mannheim: WB exit, EB enter. Zone 2
Harlem: WB exit, EB enter. Zone 2
Cicero: WB enter & exit EB exit. Zone 2
I-55: from N55 to EB, from S55 to WB maybe. Zone 3
Archer, Western & 49th: Probably WB exit to Archer, EB enter. Maybe a free frontage to/from Western with WB enter, EB exit. Zone 4
59th & Western: WB exit, EB enter. Zone 5
At Ryan: WB enter from State St. EB exit at Yale cross 63rd to SB Ryan. Zone 6
Cross Ryan, merge with Skyway. Zone 6

Sixteen miles, MINIMAL neighborhood disruption. Only two areas that have any residential.

59th around Englewood? The high school is yards away from four NS tracks, so some of that would need to be rebuilt, maybe in the parking lot, and the parking lot could move under the new highway. Theres twenty homes that would probably have to go, and twenty more that would be close, but then its just two junkyards, two strip malls, a few commercials that could probably all stay.

Berwyn to Westchester has minimal residential destruction. Mostly its "AIMBY" already a major railroad yards away from my garage or backyard. Probably twenty of those. So the property wouldnt need to be destroyed, but theres a monstrosity there now. If ya' couldnt handle it, find a new home. It would be bought for you and somebody would like the old one. After that just a bunch of parking lots and truck yards.

New grade-separations along CN rails in this area would include Riverside Dr., Harlem (IL43), 26th St., Veterans Dr., Hainesworth , DesPlaines Av, Cermak, First Av.(IL171), 17th Av., Oak Ridge Av., Harrison St., and Wolf Rd.

Heres a recent Tribune article describing an $8B rail bypass plan?? www.greatlakesbasin.net

http://www.chicagotribune.com/business/ct-illinois-rail-line-0322-biz-20160318-story.html

Why not just build the few miles of rails needed between CN & BNSF in Cicero and CSX and NSX in Englewood?

As six of seven Class 1 RRs, numerous short lines, METRA and AMTRAK collide here everyday, grade-separated rail lines along the same Hypo route would enable the RRs to get thru town in an hour, instead of days. The old IC (now CN) RR line can be seen briefly at the Strangler. Thats the vector.

Whats an alternative?? Widen the IKE?
http://eisenhowerexpressway.com/pdfs/i290%20alternatives%20evaluation%20summary2013apr02.pdf

It could take TEN years and cost $4B? Not insurmountable for a region that has a $550B a YEAR GDP. In NYC thats pocket change. A public-private partner-ship (PPP) would be needed to fund a project like this which would have to include IDOT, ISTHA, CMAP, Federal & CMAQ funds, CREATE (www.createprogram.org/proj_map2.htm), state, county, city, the RRs, construction contractors, tollway funders...even the bastards that stole (then sold for 50% profit?) the Skyway rights. Yes it would be like nailing jello to a wall. This is like a chess game, jigsaw puzzle, and crossword rolled into one.

As always, I maintain that federal fuel taxes need a modest increase, as they havent been raised since 1993, havent even kept up with inflation. Maybe a small tax (pennies per gallon) on railroad or off-road diesel to help finance more CREATE type projects. Everyone agrees that more infrastructure spending is a great idea...why are our legislators unable to get this done? It looks like very cheap fuel for the next TEN YEARS?

We also need to take a look at the give/get in the FEDERAL HIGHWAY TRUST FUND. Illinois is one of many industrial states that dont get what they put in. In IL its like 97%. And then Springfield only gives IDOT D1 (six county metro area, 65% population & 75% GDP) 45% of those funds, the rest of the state gets 55%?? So does that mean for every dollar D1 gives, we get 43 cents? I still dont know how the numbers pan out and CMAP isnt sure either.

The GDP of the SEVEN Chicagoland counties is equal to Ohios OR almost New Jersey. By comparison, the rest of IL is about Kentucky on a good year.

Heres this years version of "Chicago traffic woes" story...Note the maps on page two.

http://www.cmap.illinois.gov/documents/10180/359519/2015-08-26-Chicago-traffic-among-worst-Chicago-Tribune.pdf/5338ec11-819c-4dda-a25e-a24593238775

Maybe if it gets worse, well get some kind of "draft pick"? Hypotenuse would relieve, maybe eliminate those FIVE, and maybe help a few others. Think about it. At the Strangler, FOUR major Interstates (Is 290, N&S 294 & 88 with six lanes) merge into ONE four-lane. With IL 38, 56, 64, US 12, 20, 45 all giving a boost. The Ryan has ultimately FOUR into ONE as well(Is 57, 94, then 90 & 55), all finally meeting up at Byrnecircle. If we could connect or give options to these EIGHT routes with one sixteen mile $4B Tollway, that would be a major triumph in ten years. Kill five zombie pteradactyls with one gigantic, 16-mile hunk of concrete and steel FOREVER.

Construction techniques for the "last link" in I-70 finished 25 years ago that may be useful for building Hypotenuse, the "last link" in I-90. But NO mountain canyon, just boring railyards and ROWs, a half-mile of some pretty sparse Chicago neighborhood. Still would be beautiful. I watched Glenwood Canyon construction in the eighties.

QUESTIONS? CALL 1-800-TRIBUNE | WEDNESDAY, AUGUST 26, 2015 | BREAKING NEWS AT CHICAGOTRIBUNE.COM

JOSE M. OSORIO/CHICAGO TRIBUNE

Traffic clogs the Kennedy Expressway during the morning commute Tuesday. Such congestion puts Chicago high in a new transportation study.

Chicago traffic among worst

5 of 20 most-congested stretches of road in region

BY JON HILKEVITCH
Chicago Tribune

Five of the 20 most congested stretches of road in the U.S. are in the Chicago area, according to a new study that concludes that traffic has rebounded completely from the Great Recession — and that motorists are paying the price.

Drivers in the northeastern Illinois-northwest Indiana region suffered the misery of 61 extra hours behind the wheel on average in 2014 — equivalent to a week and a half of work — because of delays caused by gridlock, construction zones and collisions that tied up traffic, according to the Urban Mobility Scorecard released late Tuesday by the Texas A&M Transportation Institute.

The time wasted last year because traffic flow lagged well below speed limits during much of the day was six hours more per driver than the 55 hours lost in 2009, a year after the recession began. From 2013 to 2014 alone, the annual delay grew two hours, the report noted.

Increased traffic congestion is directly related to the post-recession rebound, said Bill Eisele, a

Turn to ***Traffic, Page 6***

CHICAGO TRIBUNE

Area gas prices should start coming down

BP on Tuesday said a crude distillation unit at its Whiting refinery is back online. It had shut down unexpectedly more than two weeks ago, causing area gasoline prices to skyrocket. Analysts say prices should fall shortly, but it might take some time for them to reach the low levels seen before the shutdown. **Business**

PHIL VELASQUEZ/CHICAGO TRIBUNE

Interstate 90/94 westbound at Jackson Boulevard is part of the fourth-worst stretch of congested roadway in the U.S. Experts say traffic grew worse as the economy improved.

Study computes time lost in traffic

Traffic, *from Page 1*

senior research engineer at the transportation institute and the report's co-author. The recovery is a double-edged sword.

"You can cheer for economic activity or for lower congestion, but it is difficult to have both unless improvements are made to the transportation system," Eisele said.

The Los Angeles area took the top three spots on the congestion scorecard for last year. Locally, different stretches of the Kennedy and Dan Ryan expressways (Interstate 90/94) gave motorists the biggest headaches, accounting for three spots in the top 20. Two areas on the Eisenhower Expressway (I-290) also were among the 20 most congested.

Coming in at No. 4 nationally was I-90/94 westbound from 35th Street to the Edens junction. The report noted that 4 p.m. on Fridays tended to be the worst time to be driving on the 13-mile section of road where average speeds were as slow as 16 mph. The eastbound stretch from Montrose Avenue to Ruble Street, just south of Roosevelt Road, ranked seventh nationally.

Coming in at No. 14 nationally was the Jane Addams Memorial Tollway (I-90) eastbound starting at the Tri-State Tollway (I-294) and extending to the Kennedy at the Edens (I-94) merge, the report said. Drivers who regularly travel the route can expect to spend 57 extra hours a year compared with driving in smoothly flowing traffic, the report said.

And although the price of gasoline last year in the Chicago region, $3.37 a gallon on average, was cheaper overall than it was during the previous three years, the commuter who drove predominantly during peak hours in 2014 paid what amounts to a congestion tax of an extra $1,445, or almost $30 a week, the scorecard said. The report pegged the additional costs, which totaled $7.2 billion region-wide, to such factors as lower miles per gallon caused by stop-and-go conditions, lost productivity at work, commuting stress and diminished quality of life.

Congestion resulted in 29 extra gallons of fuel burned per commuter last year, which for some vehicles represents about two tanks of gas.

As bad as it may have seemed to drivers constantly tapping their brake pedals on Chicago-area interstates, the region ranked a perhaps surprising No. 8 in the U.S. in terms of delay hours for each commuter due to traffic congestion.

While bus and train riders like to complain about slow and unreliable service, roadway congestion here would have been staggeringly worse without the 1.6 million CTA rides and the 300,000 Metra rides each weekday, plus service provided by Pace in the suburbs and the city and the South Shore Line commuter rail running between South Bend, Ind., and downtown Chicago.

The Washington, D.C., area, at a numbing 82 hours of delay per commuter, ranked No. 1 on the Texas A&M list of the most gridlocked metropolitan areas last year. Rounding out the top 10 were Los Angeles; San Francisco; New York; San Jose, Calif.; Boston; Seattle; Chicago; Houston; and Dallas.

Nationally, delays due to traffic congestion last year kept drivers and their passengers cooped up in cars for almost 7 billion extra hours and more than 3 billion gallons of fuel were wasted, according to the Texas A&M report, which was jointly produced with INRIX, a data technology company.

Officials at INRIX and Texas A&M said they pulled travel data from almost every mile of major streets and highways in urban America for almost every 15-minute period of the average day. A total of 900 million "speed data points" helped determine that the total nationwide price tag of congestion in the U.S. was $160 billion in 2014, officials said.

"The national congestion recession is over," the report concluded. "The total congestion problem is larger than the pre-recession levels."

The greater urban area that includes the city of Chicago ranked No. 3 in two categories:

- Total travel delay, at 302.6 million hours when adding up the waits of the 3.4 million commuters in the region in 2014.
- The cost of truck congestion, at $1.5 billion in 2014. It accounted for about 5 percent of the $28 billion nationally last year in the value of operating time and wasted fuel for commercial trucks stuck in traffic and adding to congestion, the report said.

Another way to look at the stranglehold is that a driver in the Chicago region who needs to arrive on time at a destination that is 20 minutes away in light traffic should instead budget a full hour to get there during peak travel times, Eisele said.

But a better solution is needed, as the Texas A&M report and other congestion studies indicate that urban congestion will only get worse if not aggressively addressed.

Experts say possible enhancements include expanding roadway capacity, providing incentives for people to alter their travel times away from the 6 to 10 a.m. and 3 to 7 p.m. peak hours, and expanding public transit and attracting new riders with new services that include new rail lines and bus rapid transit, airport express trains and options directed at luring reverse commuters from their cars to trains and buses.

"The first thing we need is leadership in Congress to step forward and properly fund a federal transportation bill. It is way past time to take a look at increasing the federal gas tax, and the fact that it is not indexed to inflation is just a crime," said Joseph Szabo, executive director of the Chicago Metropolitan Agency for Planning, which is the official planning organization for the region.

"You can cheer for economic activity or for lower congestion, but it is difficult to have both."

— Bill Eisele, senior research engineer, Texas A&M Transportation Institute

Temporary extensions for federal transportation funding have been passed because Democrats and Republicans in Congress are at an impasse on long-term legislation.

"There is no question, not just in Chicago but as you look across the country at our infrastructure deficit, that what's going on with transportation, (insufficient investment) is choking our economic growth and impacting quality of life," said Szabo, who was administrator of the Federal Railroad Administration for the Obama administration.

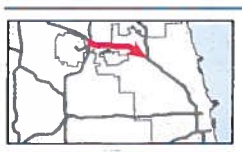
Ranking Chicago-area traffic

A study that tracks time and cost of traffic congestion shows Chicago, like most other major urban areas, saw a big jump in traffic since the end of the recession. Chicago's ranking relative to other major cities didn't change much, putting it among the worst cities for commuting.

CHICAGO'S CONGESTED INTERSTATES

According to the study, five stretches of local interstate fall within the 20 worst roads in the U.S. out of 356 for traffic congestion, during Friday evening rush hour.

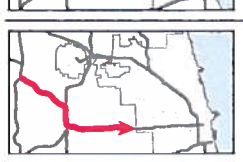


Interstate 90-94 Westbound 35th St. to the Kennedy/Edens exchange *(13 miles)* — Rank: **4th-worst** *out of 356*

Peak travel time	Worst avg. speed	Delay at peak (minutes)
Evening rush	16 mph (4 p.m.)	34

Interstate 90-94 Eastbound Montrose Ave. to Ruble St. *(9 miles)* — Rank: **7th-worst**

Peak travel time	Worst avg. speed	Delay at peak (minutes)
Evening rush	14 mph (4 p.m.)	25



Interstate 90 Eastbound from Interstate 294 to Interstate 94 *(8 miles)* — Rank: **14th-worst**

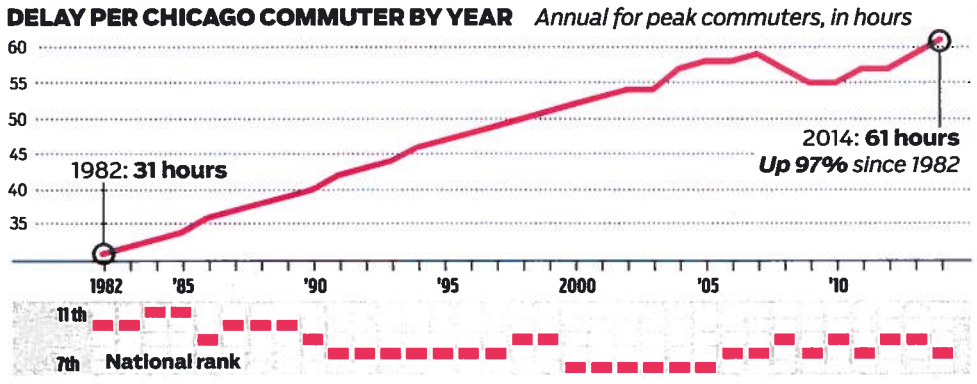
Peak travel time	Worst avg. speed	Delay at peak (minutes)
Evening rush	13 mph (5 p.m.)	22

Interstate 290 Westbound from Damen Ave. to 9th Ave. in Maywood *(9 miles)* — Rank: **15th-worst**

Peak travel time	Worst avg. speed	Delay at peak (minutes)
Evening rush	13 mph (4 p.m.)	27

Interstate 290 Eastbound Illinois 53 to Austin Blvd. *(22 miles)* — Rank: **20th-worst**

Peak travel time	Worst avg. speed	Delay at peak (minutes)
Evening rush	22 mph (5 p.m.)	39



YEARLY CONGESTION COSTS PER COMMUTER

For peak commuter, 2014

Rank	Urban area	Travel delay (hours)	Cost	Fuel (Gallons)
1.	Washington, D.C.	82	$1,834	35
2.	Los Angeles	80	$1,711	25
3.	San Francisco	78	$1,675	33
4.	New York	74	$1,739	35
5.	San Jose	67	$1,422	28
6.	Boston	64	$1,388	30
7.	Seattle	63	$1,491	28
8.	**Chicago**	**61**	**$1,445**	**29**
9.	Houston	61	$1,490	29
10.	Dallas	53	$1,185	22

DELAY PER CHICAGO COMMUTER BY YEAR

The IKE's inconsistent exit and entrance ramps cause delays from merging traffic. Some are on the left side others are on the right. Traffic slows when the ramps are on the left, which is supposed to be the lane for faster moving traffic. All ramps should be moved to right-hand side of the road. IDOT should also consider tunneling so the CTA trains could be moved underground and then using that area for additional lanes. Those lanes could be tolled to cover the costs. 1 2

Eisenhower expressway

Comment Form

Public Hearing

Illinois Department of Transportation

Please select date: [X] *January 25, 2017* [ ] *January 26, 2017* [ ] *I was unable to attend*

The Illinois Department of Transportation (IDOT) is holding public hearings on the Eisenhower Expressway Draft Environmental Impact Statement (DEIS), which is evaluating transportation improvements on Interstate 290 in Cook County, Illinois. The DEIS evaluates the section of Interstate 290 from west of Mannheim Road to Racine Avenue. The DEIS is a compilation of stakeholder outreach and comprehensive information about the project's purpose and need, alternatives under consideration, the preferred alternative, social, economic, and environmental effects and proposed mitigation strategies, and potential effects on future traffic operations. The findings of the CTA's Blue Line Vision Study will also be presented.

Public comments will be accepted through Monday, February 13, 2017. Please place your comment forms in the box marked COMMENTS; **or** fold in thirds, tape closed, place a stamp and mail; **or** fax to (847) 705-4159. Comments can also be submitted on the project website at www.EisenhowerExpressway.com.

The public is encouraged to review and comment on the:

- Project's purpose and need for the improvement
- Alternatives under consideration
- Preferred Alternative
- Preliminary road closure plan for Harrison Street and Bataan Drive at 1st Avenue
- Social, economic, and environmental effects and proposed mitigation strategies
- Proposed Section 4(f) *de minimis* impacts for improvements at public parks (Veterans Park, the Dog Park, and the proposed Recreation Center site along Circle Avenue) in the Village of Forest Park

- For the alternatives for the geometry @ the Harlem & Austin I-290 exits, it's difficult for pedestrians to get to the CTA train stations w/ continuous turning ~~moving~~ movements from the on/off ramps. In addition, drivers are making weaving movement right as they're getting off of I-290 (on Austin & Harlem) if they need to turn immediately onto the frontage roads (Harrison or Garfield). 1
- Can the noise walls be taller to accomodate balconies & apartments w/ multiple floors? 2
- Not really in favor of any tolling 3

MR. CLISSOLD: Kelly Clissold, 1032 Wisconsin, Oak Park.

Comment I had is when renderings of the noise walls are presented ongoing, they should also include a view looking directly across the Eisenhower both with and without the noise wall, and not just looking at an angle so that viewers can visualize what exactly coming up against one of those noise walls would look like aesthetically. 1

driving, which is not clearly addressed by the plan. No one should be comfortable with the plan as it is. It's outrageously expense, prolonged, and will not solve all the problems as we continue to move forward with westward expansion of Chicago. Thank you.

PS2#1595

MR. DAVIDOFF: Noam Davidoff.

There needs to be an increase in the frequency of buses that run north-south to provide greater access to east-westbound trains, Green, Blue, and Metra lines. Reconfiguring Austin and Harlem exits from the left to the right would be a prolonged and costly construction project that it appears does not appear to be worth the benefits. According to a 2014 report from the Chicago Metropolitan Agency for Planning, the daily traffic on four ramps of Harlem and Austin account for approximately 94,000 vehicles in total per day. Over a two-year construction project, that would impact approximately 7 million planned trips. 1

I do, however, agree that a fourth lane to the right westward of Austin be constructed. Separately, parking along Augusta from LaSalle to Austin should be prohibited to make way for a four-lane road. While shared lanes would theoretically improve time on the Ike, individual commuter door-to-door time would have to significantly increase in order to pick up additional riders. 2

There will be also a dangerous aspect for commuters looking for shared riders in forums like Craigslist that cannot guarantee safety. 3

The majority of significant delays on the Ike are caused by accidents. Much of this is due to distracted driving and aggressive driving, which is not clearly addressed by the plan. 4

No one should be comfortable with the plan as it is. It's outrageously expense, prolonged, and will not solve all the problems as we continue to move forward with westward expansion of Chicago. 5

Thank you.

PS2#1607

MR. DAVIDOFF: My name is Noam Davidoff and I live in Oak Park.

I am, sadly, a rush hour Ike driver. I know the pain of having to use the Ike to get downtown and back to Oak Park. Public transit is not feasible for me because bus schedules in Oak Park are too infrequent, and the hassle and cost of park-and-ride options outweigh the frustration of dealing with the Ike. Better public transit access in the western suburbs is needed to encourage drivers to leverage existing rail transit infrastructures. There needs to be an increase in frequency of buses that run north-south to provide better access to east-west trains such as the Blue Line, the Green Line, and the Metra. While increasing parking near rail lines benefits some, for most the hassle outweighs the benefits. 1

Reconfiguring the Austin-Harlem exits from the left to the right would be a prolonged and costly construction project that does not, in appearance, seem to be worth the benefits. According to a 2014 report from the Chicago Metropolitan Agency for Planning, the daily traffic on four ramps of both Harlem and Austin account for 94,000 vehicles in total per day. Over a, let's say, two-year construction project, that would inconvenience roughly 70 million planned trips. The magnitude of the impact to through traffic would be even more exponentially worse. 2

I do, however, agree that a fourth lane between Austin and Harlem and beyond be constructed to the right, as that project would be less costly and less disruptive than moving the ramps to the right while also minimizing bottlenecks. 3

In that, the westbound entrance from Harlem should be extended similarly to the eastbound entrance on Austin to provide drivers with additional merging time. While shared lanes would theoretically improve time on the Ike, individual commuter door-to-door time would have to increase significantly in order to pick up additional riders. There would also be a dangerous aspect of commuters looking for shared rides in forums that cannot guarantee their safety such as identifying people on Craigslist. 4

The majority of significant delays on the Ike are usually caused by accidents. Drivers are distracted and are driving aggressively. We need our police force to have better laws and better enforcement of those laws in order to make the Ike a safer place to drive and reduce the speeds so that merging and changing lanes can be done safely. 5

No one should be comfortable with the proposed plan. It's outrageously expensive, prolonged, and will not solve the long-term problem of ever-increasing traffic on the Ike as people continue to move to the western suburbs. It's my concern that there needs to be additional emphasis on rail transit access and that that should be the long-term solution. 6

Thank you.

PS2#1622

1) The Blue Line MUST be extended. The single biggest problem with the IDOT plan and their attitude is their refusal to seriously consider any attempt to extend the CTA Blue Line. I read one document they produced a year or two ago claiming to have explored this possibility. It concluded that extending the Blue Line would not produce one additional rider! This is so obviously absurd it I could not believe I was reading it! 1

With the proposed new construction it is clearly a perfect time to extend the Blue Line. The effect on Eisenhower traffic would be phenomenal.

2) Widening the section of the Eisenhower that is now three lanes, without widening the section east of this would INCREASE traffic from Oak Park into Chicago. This is absolutely certain. Every additional car from the wider section will increase inbound traffic. Already every morning the Ike is stopped during rush hour (frequently 30-50 minutes from Oak Park to the Loop, which should be 8 minutes). This winter, inbound traffic every morning is routinely at least 1 standard deviation above the mean travel time for the past 3 years. Selective widening of the 3 lanes to 4 would make this infinitely worse. 2

3) **Noise walls** help for those right next to the expressway, but create ugliness and claustrophobia for everyone else. Covering the expressway with a park would be a great solution. 3

Dear Expressway Committee, after reading the latest news bulletin about the HOT 3+ lanes, I would like to submit an idea that I've had for several years about the Eisenhower Expressway. My idea would be to make the expressway a Variable Speed Expressway System (VSES). Average speed would be monitored and posted on electronic signs. During heavy use average speed would be less, making merging onto expressway easier with fewer back ups and accidents. If during heavy use every motorist went 40-45 MPH I believe there would be fewer back ups and fewer areas of major congestion. Best Regards, Dan Diener 1

PS2#1610

MS. ESTER: My first name is Readith, last name Ester. Address 1931 South 25th Avenue, Maywood, 60153.

I had two concerns. One, the walls. I know that's going to be discussed later but it just doesn't seem to be an understanding as to whose responsibility it's going to be to maintain them.

There are walls in Hillside along the expressway that are not that old, they look ugly, there's cracks and greenery is growing through them. In the city the retention wall are cracking, they look horrible along the Eisenhower expressway.

1

My concern is that eventually it's going to just be an extension of that ugly, poorly maintained. They are talking about now enhancing the landscaping and some additional walls. Who's going to maintain it? Because if you put greenery out there, we need to know. Some communities can't afford it so that's going to go ignored. Why even spend the money on that when the money could be used for something else.

My other concern is the Pulaski, Keeler, Cicero, Lavergne ramps seems that they are too long. The safety of the riders is being jeopardized for those areas with that long space and there's not 24-hour security in place. The money seems it could be better utilized if you just have the smaller ramps and allow people to have access to those stations via some level of transportation, a different mode of transportation from one point to another. Say for instance from one end to another on bus routes, along bus routes. The entrances to the El stations if they were along areas where there are bus routes it would be better for the residents.

Currently, the Sight Lines at Lombard Bridge at Garfield and Lombard are obstructed by concrete walls combined with the sharp angle of the bridge merging into Garfield. Drivers make wide turns because of the lack of good Site Lines. The bridge acts as a walk way for Irving Elementary School children from their homes to school; the area is located by a park and community center with children drop off areas; and the Lombard CTA access point is located here. Since the bridge is IDOTs responsibility w/r/t building and design, the site lines and pedestrian traffic (specifically for small children) needs to be improved. Additionally, a Divvy bike station is located here. Many bicyclists cross at this bridge (since Ridgeland is a very busy street). Children ride their bikes over this bridge to their school friends located on the other side of the highway and to baseball and soccer games that occur at Barrie Park. A bike lane should be added to this bridge to assist with cyclist safety. It is not currently safe and the design needs to be greatly improved. Please consider adding speed tables or rumble strips prior to pedestrian walk ways to decrease driver speed. 1

Public Hearing

Illinois Department of Transportation

Please select date: [X] *January 25, 2017* [ ] *January 26, 2017* [ ] *I was unable to attend*

The Illinois Department of Transportation (IDOT) is holding public hearings on the Eisenhower Expressway Draft Environmental Impact Statement (DEIS), which is evaluating transportation improvements on Interstate 290 in Cook County, Illinois. The DEIS evaluates the section of Interstate 290 from west of Mannheim Road to Racine Avenue. The DEIS is a compilation of stakeholder outreach and comprehensive information about the project's purpose and need, alternatives under consideration, the preferred alternative, social, economic, and environmental effects and proposed mitigation strategies, and potential effects on future traffic operations. The findings of the CTA's Blue Line Vision Study will also be presented.

Public comments will be accepted through Monday, February 13, 2017. Please place your comment forms in the box marked COMMENTS; **or** fold in thirds, tape closed, place a stamp and mail; **or** fax to (847) 705-4159. Comments can also be submitted on the project website at www.EisenhowerExpressway.com.

The public is encouraged to review and comment on the:

- **Project's purpose and need for the improvement**
- **Alternatives under consideration**
- **Preferred Alternative**
- **Preliminary road closure plan for Harrison Street and Bataan Drive at 1st Avenue**
- **Social, economic, and environmental effects and proposed mitigation strategies**
- **Proposed Section 4(f) *de minimis* impacts for improvements at public parks (Veterans Park, the Dog Park, and the proposed Recreation Center site along Circle Avenue) in the Village of Forest Park**

This project is desperately needed! Adding a HOT tolling lane is a creative idea and should be pursued, especially since transportation funding has become very challenged. With public infrastructure falling apart, governments and agencies need more options to repair our ~~[illegible]~~ infrastructure. The concepts shown are very creative and well thought out. Let's keep this project moving ~~[illegible]~~ forward! 1

I live two houses south of the expressway in Oak Park. I soundly reject the proposal for sound walls. Not only are they unsightly, I expect that they will negatively impact my property value, their effectiveness minimal and will create even more of a divide between north and south Oak Park. I also suggest that the designers consider capping the Eisenhower. Doing so can create additional green space for the village and is visually more pleasant than looking at the expressway and possibly sound walls. 1 2

I think this project would benefit the region as a whole. However, if the exits on Harlem and Austin Ave are moved to right lane exits, then the overpasses should also be fixed. They are unsafe for pedestrians and drivers alike, and make it harder for people in the community to access the Blue Line. 1

Now would be the time add more than one lane since capacity issues have not been addressed since the highway was first put into service. The addition of two more lanes in each direction will be a positive to the region for several generations. Thank you.

Michael Grandy

82 S. Carence, Oak Park, IL

MR. GRANDY: Michael Grandy, 825 South Clarence, Oak Park.

I think I got involved in this thing about 8 or 10 years ago when it first started. As near as I can figure, it should have been just probably ready to start already. I think we are still waiting. Jim, I think you are safe.

A couple things that perplexed me is when we initially got this going we had talked about or it seemed to be coming at us that the Blue Line extension was going to happen sometime. And now I'm hearing that it's being pointed at the CTA instead of the RTA. And as I said, that perplexes me. 1

Second point would just be an overall comment on the flyovers. Don't like them, don't like them at all. I think they are going to be, going to be big. They are going to be ugly. They are going to be noisy. And I think that they are going to reduce what passes for the quality of life in a very congested urban environment. 2

MR. HARMET: With respect to the Blue Line extension, that has been and continues to be something with a very high stakeholder interest. And we partnered with the CTA, you can see the initial evaluation. And what we found was the Blue Line extension, average ridership would be coming from existing other existing transit services. So that was telling us we really didn't have the density of land use there to support it as a standalone project.

But what we have done is provide a corridor and space for a future extension. And as the initial service, looking at having express bus service in that managed lane corridor. So preserving it for the future, we did test it, did rigorous analysis about what to do overall.

MS. FARZIN: Yes. For CTA we had limited scope with it, with the Vision Study. We followed the modeling results that IDOT did looking at extension possibilities. But for us the focus was on the existing infrastructure and shoring that up to at least from current design speeds providing accessibility for the branch.

Some basic things that for us it's not practicable to look at an extension before we take care of the existing infrastructure that we already have. So that's our first focus. And when that's taken care of, then we start to explore the possibility of an extension.

MR. HARMET: With respect to Harlem and Austin, we did do some detailed analysis in terms of noise and air. And there certainly is some advantages in terms of noise with the design kind of walling off the Eisenhower. So there was some advantages certainly there, and we didn't find an air quality impact where a more microscaled analysis would be a visual change. But we wanted to continue to work with the village and all the communities on aesthetics and other things to really blend as much as we can with the surrounding communities.

So then we will go back to some of the other issues. We did take a real extensive look at transit as part of the study; and there is a lot of existing north-south bus service that's configured to do those things, connect those CTA rail lines. We are proposing some slight refinement to that as part of our preferred alternative.

But the Eisenhower is beyond, the bridges, in particular, beyond their useful design life. So we won't have a transit solution to addressing those types of problems on the Eisenhower, it needs to be reconstructed regardless. The benefits, we even looked at improving the drainage system. Heavy rains we have had in the last 5 plus years, the Eisenhower completely closed. Where does all that traffic go, in to your communities. So we needed to make some major investments in the size to keep traffic where it needs to be and have it serve its function. It's a vital corridor.

In terms of Harlem and Austin, concentration of, we see the crash rates being higher at those intersections, interchanges. National studies have shown that those left-side ramps are anywhere from 60 to 180 percent less safe than right-side ramps.

So we have come up with a unique design that, even though it is an interstate interchange, it's a much more pedestrian- friendly type component so far as transit access and crossing through there. Today the sidewalk just disappears. And so we want to have defined areas, pedestrian plazas connect up to these, plus a proposed bike path. Construction on a major project is always a challenge. But again, that's something that the Department of Transportation is going to be working closely with the communities during final design to come up with a plan for construction. Here today we are in the planning phase.

We are talking about concepts. Ride sharing. You know, it's something, car pooling is happening today on the Eisenhower. It's one of the things that makes a HOT lane work as well as the modeling shows. So I really can't say how that would be administered. But certainly that's something that encourages sustainable practices and gets more efficiency out of an existing corridor. Certainly crashes do cause congestion but vehicles are just causing congestion as well. The west end of the Eisenhower is about 40 percent overcapacity today, the number of cars that should fit in that number of lanes.

So what we are proposing is improving the efficiency of that existing corridor without dramatically expanding its footprint. So that HOT lane is going to increase that efficiency, the tolling is structured to provide a 45-mile-an-hour trip, which you can't count on day in and day out today on the Eisenhower.

We will also see travel improvements in those general purpose lanes.

So a lot of reasons to undertake it. And I can say that we don't start off with planning, planning is to develop a plan and consensus. And we are going to work on a financial plan as well, but we have got to get step I solved first.

Please go forth with this project and make sure that those who travel in groups are able to use the HOV lane for free. 1 Also, please consider removing the entrances and exits within Oak Park. They are least of all an eyesore and most of all a highly inefficient and unsafe design. 2 As close to the city as Oak Park is, their residents should use side streets and frontage roads in their commute, and no one from the outer suburbs is traveling to there anyway. Thank you. 3

The "environmental impact" of road building is always the same: additional pollution caused by automobile emissions, additional deaths and injuries caused by automobile traffic and the squandering of public funds on subsidies to automobile drivers. 1

Federal and state funds dedicated to this project would be better spent on improving bus and rail service. 2

PS2#1617

Michele Gurgas

1047 Highland Ave. Oak Park, IL

MS. GURGAS: Michele Gurgas, 1047 Highland Avenue in Oak Park, Illinois.

I have got a little bit of a laundry list. First, I was late because the CTA line stop on the flyer was incorrect. So it's a quarter mile away, so it took me a little while to get here so I don't have all the information because I just pulled on in. So some of this might be redundant. You list out the public paths for expansions. Have those been identified and who would fund those? 1

For the HOV lane, how do you plan on doing enforcement? Because they are fine. But if they are not properly enforced, they are not very effective. Also, with safety, given those HOV lanes, if you end up having the lane size reduced a little bit below standard roadways for Oak Park specifically, what are the current design heights for the off ramps? 2

And I can't remember what the status of digging down the Ike was. When are you planning on resurveying the noise wall, survey? And those are the end of my questions. 3 4

MR. HARMET: What was the second to last one?

MS. GURGAS: The off ramps, was it the off ramps.

MR. HARMET: Digging down.

MS. GURGAS: I wasn't sure what the status of when you were digging down to be able to do the ramps.

Oh, and then my last one was some of the bridges between the off ramps, what is the current design pitch on those? Because when I was trying to read the EIS, I was having a hard time finding that. 5

Thank you.

MR. HARMET: In terms of the paths and sidewalks, the department has a standard policy. And it's 80 percent state and 20 percent local. So we have actually identified that in the Village of Oak Park. All those costs are in the letter of intent. And certainly it's 100 percent IDOT cost for anything that's replaced that's disturbed by construction.

The wider sidewalks on the bridges -- Did you have another question?

MS. GURGAS: I was going to say it is 80 percent IDOT payment? 1

MR. HARMET: And then the sidewalks on the bridges are IDOT cost.

MS. GURGAS: Yes.

MR. HARMET: In terms of enforcement for the HOT lane, what we will start with is looking at the best ideas across the country, what are the best practices because there is HOT lanes in operation all over the country so we will look at that.

And I think by the time this gets to construction, because that would be the last thing that's built is bolting on all that infrastructure to whatever the Eisenhower reconstructed looks like. And so as the technology evolves, you will be looking at that as well. I think for an urban corridor like this, you would be looking at electronic means primarily.

In terms of safety with the lane widths, we did analyses of lane widths versus shoulder widths. And we found that shoulder widths had a much bigger safety benefit than lane widths. And with regard to the shoulder widths, there wouldn't be, like there is today, full shoulders everywhere. But one of the things we are going to do as well is something called dynamic lane management where you see those red X's or green X's over a lane, similar to what's out there on I-90 being built today, the Jane Adams Tollway.

The ramps at Harlem and Austin are consistent with those 3D models that we had prepared over the summer I think it was, might have been the summer of '15.

And then we explored lowering the Expressway. We actually are lowering the Expressway in several locations, particularly at Harlem Avenue. But we can't go any lower than we have identified because then we get into drainage problems as well as if we are sinking down the Eisenhower and the railroads, eventually the railroads have to climb back up out of there, and they can only go so steep. So the CSX climbs back over the Eisenhower to the west.

The crossroad bridges would be either at the same height or lower. We were able to work with the CSX railroad to identify and improve clearance without raising those crossroad bridges.

MS. MORSE: The noise wall, revisiting the noise wall was one of the other ones. | 4

MR. HARMET: Thank you because I could not read my own notes.

And noise walls would be another, in a project like this. The design plans would not be pursued all at the same time. It probably would be in layers and stages; and the noise walls might be one of those end items, again, is what gets constructed. And so, therefore, later in the design phase. But when the design phase comes up for the noise walls, the department will go back to the communities and ask the question has public sentiment changed. And if so, then reopen the issue for discussion.

If there is no -- public sentiment hasn't changed, has not changed, we just focus on aesthetics, what would the wall look like.

PS2#1567

To Whom It May Concern, These are my comments regarding the EIS currently under public comment for the I290 expansion. I attended the January 26, 2017 IDOT Public Meeting. Below is some specific information which was conveyed to me by IDOT staff which I would like to confirmed during this public comment period. Austin Bridge: Current Garfield/Harrison streets are at around 615-620 ft. Austin bridge overpass will be 625 ft. The fly over off ramps will be 2-4 feet higher than Garfield Road at the highest point. There will be an approximate 4 foot high concrete wall along Garfield to help block the view of the fly over ramp (not the sound wall). The highway by Austin will be dug down 5 feet. If this information is accurate, I have no comments regarding the Austin bridge and associated fly over off ramps. 1

Harlem Bridge: By Wenonah, the fly over off ramp will be 6 feet below surface street. By Maple, the fly over off ramp will be 3 feet higher than surface street. There will be an approximately 4-5 foot high concrete wall in that area to block view (not the sound wall). The highway by Harlem will be dug down 7 feet. If this information is accurate, I have no comments regarding the Harlem bridge and associated fly over off ramps. 2

Lombard Bridge: The bridge will be 1 foot lower. Currently, the Sight Lines in this area are obstructed by concrete walls combined with the sharp angle of the bridge merging into Garfield. Drivers make wide turns because of the lack of good Site Lines. The bridge acts as a walk way for Irving Elementary School children from their homes to school; the area is located by a park and community center with children drop off areas; and the Lombard CTA access point is located here. Since the bridge is IDOTs responsibility w/r/t building and design, the site lines and pedestrian traffic (specifically for small children) needs to be improved. Additionally, a Divvy bike station is located here. Many bicycles cross at this bridge (since Ridgeland is a very busy street). Children ride their bikes over this bridge to their school friends located on the other side of the highway and to baseball and soccer games that occur at Barrie Park. A bike lane should be added to this bridge to assist with cyclist safety. Please note I know individuals who have been hit by cars multiple times at this intersection. It is not currently safe and the design needs to greatly improved. Please consider adding speed tables or rumble strips prior to pedestrian walk ways to decrease driver speed. 3

Lanes: HOT Lanes - will only be divided by paint lines and there are no current plans for enforcement. A more concrete plan should be developed for enforcement of these lanes. Lanes will be decreased from 12 feet wide to 11 feet wide, all areas will have a minimum of 4 foot shoulder (even under bridges). Please confirm. These reductions in lane and shoulder widths are a safety concern to me. 4

Ancillary Items: Noise wall - will be revisited and citizens re-surveyed again during construction. Oak Park was divided by the highway and we do not need sound walls to add to the separation in our community. 5

Public Paths - 80% funded by IDOT, 20% by local municipalities. IDOT will be paying for 80% of the walk ways and bike paths as shown in the design drawings including plantings and art work. IDOT will be upgrading a number of artillery roads (North, 6

Cermak, I55, Madison, and Roosevelt). Please consult with the City of Oak Park as they are planning to decrease lanes along Madison. Traffic will be very bad in our community during construction. Added safety measures need to be implemented to keep pedestrians and cyclists safe. Pedestrian Safety 6

The pedestrian crossings still appear to be unsafe at Harlem and Austin. Speed tables or rumble strips should be inserted prior to pedestrian walk ways to decrease driver speed. CTA: CTA selling 10 feet of their right of way to IDOT for highway expansion; there will be no future ability to add express trains to the Blue Line. No reduction in access to any CTA locations. Additionally note, the IDOT flyer gave the wrong directions to this Public Comment / Informational event with the directions leaving CTA riders about 1/4 mile from the hotel. I took public transit and was late to the event due to this inaccurate information. I think this mix up makes IDOT look bad and reinforces the public perceptions that IDOT is only about building and expanding roads and is not an advocate for holistic transportation solutions. Please do a thorough evaluation of the site lines and design of the bridge at Lombard Ave. in Oak Park. There is a great deal of foot traffic on the south side of the bridge, and the height of the sidewalk and the narrowness of Garfield Ave. make turns difficult and dangerous. 1

I live just down the block at 1139 S. Lombard and can attest to how dangerous an intersection this is esp. with the litte ones playing in the tot lot and the height of the curb that curves around so quickly. It is very hard to see whether pedestrians or bikers or skateboarders are coming up to the intersection. Please make this intersection more safe as many people with children walk to and from the park as well as walk from the south of OP to the El or businesses on Harrison like the Buzz Cafe. 1

PS2#1611

MS. JOHNSON: My name is Carolyn Johnson. My address is 2029 South 9th Avenue, Maywood.

And I have some comments on the Blue Line Vision, Forest Park Branch Vision Study.

First thing I was looking at was the ramps at Cicero and at Pulaski and one of the things that I noticed is that they were going to make that dual entry and the ramps appear to be long and my questions and comment had to do with the disabled. Everything is supposed to be accessible for the disabled but when you look at say the entrance at Keeler and Lavergne, you have about 500 feet to go down to the platform. And I'm thinking about a person who is disabled walking with a cane or with a wheelchair, that's a long ramp. And I understand that these were ramps that were closed years ago and my question is: Why were these ramps closed years ago? And why all of a sudden are these ramps, the idea to reopen them, what has changed in the area now that it's being considered to reopen these ramps? What kind of improvements are going to be made?

I understand that the areas are going to be covered so that people won't be walking on the outside but then what kind of safety considerations are being considered? That's a long distance. Then there's no bus route on the Keeler and Lavergne Avenue exit. There's no bus running parallel to the El that can get you down to Pulaski and I just wondered if this is the most viable means of accessing those particular exits. 1

I understand that there have been some outreach to the people in the community. I don't live in the community. So if this is something that people who live near there are interested in but just observing it, being an outside observer, these are some of the things that I saw and wanted to bring them to your attention. Again, safety, mobility and all of those things.

Thank you.

PS2#1620

Anthony Johnson

3351 W. 21st St.

MR. JOHNSON: My name is Anthony Johnson. I live at 3351 21st Street.

I live by the Blue Line, the Blue Line train, I live about two blocks down. How long they going to do the project, about a year or a couple years? Guess? That's it, no other questions. 1

MR. HARMET: At this point we don't have a schedule for construction. We just only have funding right now for this planning phase.

PS2#1596

1043 S. Harvey, Oak Park, IL 60304

MR. KELLY: Hi. My name is Jim Kelly. I live at 1043 South Harvey in Oak Park.

1043 South Harvey is a block south of the Eisenhower. I'm going to be 70 in June. So I'm wondering how much of this project I have to be concerned about in my lifetime. 1

But I am interested in knowing if you have an idea in like the best-case scenario when this project will be ready to receive funding, how much time between now and then? 2

How much time between then and funding, and how much time for all of the construction to be completed? 3

MR. HARMET: We have looked at construction at a conceptual level, and our estimate here in the planning phase is that construction would take four years in advance work, looking at overhead bridges, assessing those parallel arterial routes, North Avenue and Cermak.

And then once that is in place, we would begin the main lane construction, which would be another four years, about an eight-year process we have identified here.

The next phase of project development, final design. They will look at that in much more detail, perhaps they are able to tighten up that schedule. But the most important thing is that they will be working with the communities, the department will be, to develop a set of construction measures to manage and mitigate construction effects during that time.

But right now we don't have a schedule for starting. We do have a financial plan that we are going to put together to start to talk about the funding issue. So that occurs more in the summer timeframe and that will be part I.

driving, which is not clearly addressed by the plan. No one should be comfortable with the plan as it is. It's outrageously expense, prolonged, and will not solve all the problems as we continue to move forward with westward expansion of Chicago. Thank you.

PS2#1602

Rick Kuner

728 S. Euclid Ave. Oak Park, IL

MR. KUNER: My name is Rick Kuner. I live at 728 South Euclid Avenue in Oak Park.

I have a comment and then a question.

The mode the chair is representing at this point is operating express lanes, operating overcapacity. And even with improvements that you are talking about, it will still be overcapacity, not as much as it is now but still be overcapacity.

The mode that Janine represents is operating, the Forest Park branch, is operating under capacity. And what's causing that -- as you already know, so I'm preaching to the choir here, but for the benefit of the audience -- the O'Hare branch carries a lot more traffic than Forest Park branch. So that dictates how frequently you run trains and what the headwinds are. 1

So if you have a mode operating under capacity alongside a mode operating overcapacity, it seems to me anything both, the two of your agencies can do, to get especially choice riders out of their cars and onto transit would be helpful. You are already, you are already serving the captive riders because they don't have a choice.

And there are a variety of things you can do. And you are both qualified and you have got some good staff people and consultants so that seems to me to be doable.

The question I would ask is how amenable you are to extending the February 13 deadline? And having read or skimmed all of the EIS, which is in excess of 2200 pages, within that there are 192 figures and 78 tables, I would suggest to you what you already know is that's a lot to absorb. At this point I think we can make the February 13 deadline. But that, that may not be possible. 2

So what does it do to your schedule if we ask for extra time for providing public comments?

MR. HARMET: Well, I would say send us a letter and ask us what your specific needs are; and we will go from there.

MR. KUNER: Thank you.

When it comes to rebuilding the Lombard St. overpass, I urge you to increase the pedestrian and vehicle sight-lines at Garfield St. My daughter and I regularly walk from Barrie Park toward Harrison St. We have narrowly avoided being hit by cars as we crossed Garfield, heading north. Cars on Garfield routinely go much too fast for that street. This intersection sees regular and heavy pedestrian traffic with Barrie Park and the EL nearby. Please make this intersection safer for all pedestrians and vehicles! 1

Draft Environmental Impact Statement

Illinois Department of Transportation

BUREAU OF PROGRAMMING
RECEIVED
JAN 30 2017
DISTRICT #1

The Illinois Department of Transportation (IDOT) is holding public hearings on the Eisenhower Expressway Draft Environmental Impact Statement (DEIS), which is evaluating transportation improvements on Interstate 290 in Cook County, Illinois. The DEIS evaluates the section of Interstate 290 from west of Mannheim Road to Racine Avenue. The DEIS is a compilation of stakeholder outreach and comprehensive information about the project's purpose and need, alternatives under consideration, the preferred alternative, social, economic, and environmental effects and proposed mitigation strategies, and potential effects on future traffic operations. The findings of the CTA's Blue Line Vision Study will also be presented. **The public hearings will be held on January 25, 2017 and January 26, 2017.** Please visit the project website at **www.EisenhowerExpressway.com** for hearing locations.

Public comments will be accepted through Monday, February 13, 2017. To submit a comment form, fold it in thirds, tape closed, place a stamp and mail, or fax to (847) 705-4159. Comments can also be submitted on the project website at www.EisenhowerExpressway.com.

The public is encouraged to review and comment on the:

- Project's purpose and need for the improvement
- Alternatives under consideration
- Preferred Alternative
- Preliminary road closure plan for Harrison Street and Bataan Drive at 1st Avenue
- Social, economic, and environmental effects and proposed mitigation strategies
- Proposed Section 4(f) *de minimis* impacts for improvements at public parks (Veterans Park, the Dog Park, and the proposed Recreation Center site along Circle Avenue) in the Village of Forest Park

Date: JANUARY 11, 2017

IN HISTORICAL PERSPECTIVE, THE ORIGINAL INTENT AND PURPOSE OF THE INTER-STATE HIGHWAY SYSTEM WAS TO CONNECT AMERICAN CITIES. THIS WAS THE VISION OF GENERAL, LATER PRESIDENT, EISENHOWER; TO STOP AT THE OUTSKIRTS OF CITIES; (1959.) WHAT WAS DONE INSTEAD WAS THE CARVING UP OF CITIES AND RESIDENTIAL NEIGHBORHOODS, WE CANNOT PUT THE TOOTH-PASTE BACK INTO THE TUBE. 1

BUT WHAT WE CAN DO IS TO RESTORE, AS MUCH AS POSSIBLE, OF THE ORIGINAL INTENT. FRONTAGE ROADS MUST USE CANTILEVER WOODEN BICYCLE PATHS, ELEVATED 10 FEET ABOVE THE SURFACE. CANTILEVER CONSTRUCTION WILL (1) SAVE PRECIOUS SPACE; (2) ENABLE TWO-WAY BICYCLE JOURNEYS. AT ONE/HALF MILE INTERVALS, A DESCENT TO THE SURFACE BY GRADUAL ANGLES OF DECLINE. 2

THIS WILL ENABLE BOTH LOCAL TRAVEL AND LONG DISTANCE JOURNEYS FOR THE FIT AND HARDY. THE BICYCLES COULD BE TANDEM AS WELL AS SOLO. THINK OUT-SIDE THE BOX

I am writing regarding the proposal to add lanes to the Eisenhower Expressway.

This proposal is a waste of taxpayer money. I would suggest that those responsible for making the final decision re-familiarize themselves with their college 101 planning textbooks, and with the the law of induced demand:

An excerpt from Subrban Nation: The Rise of Sprawl and the Decline of the American Dream (Duany, Plater-Zyberk, Speck, 2000), " The simple truth is that building more highways and widening existing roads, almost always motivated by concern over traffic, does nothing to reduce traffic. In the long run, in fact, it increases traffic. This revelation is so counterintuitive that it bears repeating: adding lanes makes traffic worse. [...] The mechanism at work behind induced traffic is elegantly explained by an aphorism gaining popularity among traffic engineers: "Trying to cure traffic congestion by adding more capacity is like trying to cure obesity by loosening your belt." 1

This will not relieve traffic congestion. However, it will make the area more dangerous, less prosperous, and less healthy. It will only enrich those who build it. It is a bad idea and I'm strongly opposed to it. 2

Question:
I reside one and one half blocks north of the Eisenhower Expressway. I was a career commercial property insurance adjuster, and I can personally attest to the severe impact that such a proposed major expansion project will have on the surrounding residences and general community.

The sustained concussions from the proposed construction will fracture the underground infrastructure, especially the sewage system. Most of the residences were constructed with plaster, and there will be severe fissuring from such sustained concussion. As I stated above, as a property insurance adjuster I have had direct experience in evaluating such damages. IDOT should be placed on notice that they will be required to consider claims for such resultant property damage. 1

Also, the noise and dust will severely impact the surrounding community. More consideration needs to be given to these consequences of the proposed construction. 2

The Ike is congested most of the day because of a few bottlenecks, so adding an additional lane in both directions is nice. However, increasing lanes in the 3 to 4 bottlenecks (I-88 split, near Austin/Oak Park, before Kostner, and curvy lanes west of Route 171) could decrease traffic jams allowing the traffic to flow more smoothly throughout the day. The CTA rail system has unused space adjacent to tracks. You could possibly create flyover lanes to increase capacity where areas are too narrow to expand. 1

1. Thanks for calling them “crashes” and NOT “accidents” 1

2. The Hillside backup, where the two expressways meet, is caused by high traffic volume and distractions. The more done to reduce both, the better. Obviously more lanes over a prolonged period is preferable (and most expensive). 2

Subject: [External] Copy of comments posted to IDOT website today, re: Eisenhower Expressway "Preferred Alternative Plan"

Dear IDOT,

I am a retired lawyer with a primary residence in Oak Park (closer to North Ave. than to the Eisenhower Expy.) and a second (condo) property in the city (South Loop). I am writing to ask you to reconsider the Preferred Alternative Plan in light of the criticisms made by Citizens for Appropriate Transportation, to which I add the following comments:

—The best way to facilitate commuter traffic from exurbia is to improve public transit, especially by extending the Blue Line west from Forest Park (and/or adding high-speed rail facilities to the mix now available for exurban dwellers). I say this as a former daily commuter who always chose public transit over automobile, and still usually choose it for my less frequent travel between Oak Park and Chicago (either using CTA bus #86 from my home to the Ridgeland Ave. green line station or parking my car in an Oak Park public lot; formerly, when I owned a home in SE Oak Park, i took the Blue Line from my home to the city, and to classes and events at UIC). My reasons for this habit have included: cost and inconvenience of maintaining a personal automobile; a long habit of reading and/or working on the train; cost of parking in the city (before I purchased a parking space near my condo); and my interest in not adding to air/soil/water pollution in our state.

—The many studies reported by CAT (and others) have shown that expanding/building more highways (and deprivileging other land uses—whether agricultural/open space/recreational, residential, commercial, etc.) does NOT solve the problems of highway congestion or even safety. Rather, it seems to lengthen commutes for workers, who move farther and farther away from the city in order to "breathe clean air," exacerbating their own (and my/everyone else's) problems.

--As I have aged, I also have grown to feel safer in a train or bus (when I'm not driving), and to enjoy the interaction with younger people who ride trains in and around the city. Perhaps I should add that I am a middle-class white woman; also, that the more IDOT and CTA can do to encourage people like me to ride the trains/busses, the safer I'll feel—it's nice to have a critical mass when traveling, especially at night.

Before I moved to Oak Park, I lived most of my life either on the North Side of Chicago or northern suburbs, with 3 years in Hyde Park (law school); thus, my feelings about public transportation vs. automobile travel were molded long before I had regular encounter with the Eisenhower Expy, whose design as it passes through Oak Park is, of course, different from that of the Edens or southbound urban expressways. However, so are our (west suburban) communities; as infill continues to increase our populations, we must be thinking of long-term solutions, not just patches to the existing highway system.

In short, I prefer to have my tax monies used to improve transportation options that will serve all of northern IL, not just wealthy exurban car owners.

Thank you,

Patricia McMillen

Sent: Tuesday, February 21, 2017 3:22 PM
To: Harmet, Pete E
Subject: [External] Eisenhower expansiomn

Dear Mr. Hartmet:

My name is Kimberley Miller. I live five houses from the Eisenhower. I am appealing to you to abandon the plans indicated in your latest report.

Your group has spent too much money and too many hours deciding on things that will negatively affect the people and properties that adjoin the Eisenhower. Remember the phrase "build it and they will come"? That is what will happen with toll lanes. People already pay extraordinary prices to park their cars downtown; the tolls will not make a difference . The toll lanes will be filled and the other lanes will be filled and the Eisenhower will be the same. It will be the same air polluting, congested mess it always has been. One more lane each direction will not make a difference. 1

Your information is misleading. I believe you will be encouraging even more drivers to take their cars downtown rather than riding public transportation. I also do not believe the number of crashes you report to occur yearly. I also do not believe the number of accidents you claim to occur at the Austin and Harlem exit/entrances. 2

I hope you do not get the funding. I hope you do not cause construction horrors for years for ALL drivers. I hope you do not jeopardize the Oak Park Conservatory, our homes and businesses. I hope you do not make the air any worse than it already it is. I hope you don't risk the stability of Garfield and Harrison Streets. I hope you and your plan do not succeed. 3

Sincerely,

Kimberley Miller

MS. MONTVILLE: Fina Montville. I live in Oak Park, 900 South Winona.

One of my first questions we have a son who's disabled, he's 42 years old now. So there have been many occasions when there was time when I had to take him in the wheelchair on the CTA and it came about -- I don't know exactly when it was closed off but anyway, at the medical center there is a ramp that goes up towards I think it's Pulaski, but there's a turnstile there, not exactly accessible. When you get off the train, however, there's a stairway that will take you up. If I wanted to use another stop that has a ramp on it, I would have had to have gotten off at -- I got off at Damen, but if I had need of the ramp, the stop before it, is that Ogden if you are going east of Damen? The largest issue is the medical center Blue Line stop ADA accessibility. 1

And the other thing was that I wanted to be able to get a little bit more information about the wall. We live at 900 South Winona. So we live three blocks east of Harlem. So we have Volvo and the post office and we live just catty-corner from the mail drop-off, postal mail drop.

My question is: Where is the wall going to go? Because I think 52 percent said yes, so I figure -- is it going to go right along the highway, the expressway, or is it going to be built higher because there's like a big hill. There's a hill. Here's the post office, and then it drops, okay? (Indicating.) Whoever is reading this will know what I'm talking about, okay? I do want to find out about that.

And if the trees are going to be cut, the existing trees that are up on that line, are they going to be cut? Okay. Those are the big ones. What kind of material are they using for the walls? 2

There's always accidents on the Eisenhower. When there are accidents, there's always -- we have lived there for 40 years, so I know a lot about this. There's usually somebody from the fire department who stays above like on Harrison side or the Garfield side to observe what's going on down there, what's going on down there with the fire trucks and with the accident. Is this wall going to impede the ability for that person because I'm assuming that this man is a crucial part of the whole crew if there's an accident -- when there's an accident. I would like a reply to these questions.

MR. NORRINGTON: Paul Norrington.

With the retention, the noise wall, and I'm assuming there may be retention walls along the corridor, and landscaping, will there be opportunities for local artists to be involved in that and landscape engineers? 1

MR. HARMET: There may be opportunities. I know for developing that plan we will be working very specifically with the communities on what their desires are and vision. So that could be a possibility, but that's all yet to be discussed.

I think your earlier question, I think I didn't answer was so far as you are saying, well, what would happen and how would all that fit so far as the Eisenhower. We would add a lane in each direction without expanding the right-of-way footprint, and we would accomplish that by using 11-foot lanes on the inside through that stretch as well as using 10 feet of right-of-way from the CTA Blue Line.

As part of the Vision Study and the overall analysis, we identified that an express track would not be needed because the Blue Line today with the station spacing kind of acts as an express.

- While this project would help alleviate current congestion, I feel there are more pressing transportation issues today. One of these issues, especially in the near western suburbs of Chicago, are the amount of grade crossings. Grade separations typically cost between $10 - $30 million; this project is currently budgeted at ≈ $2.3 billion. For that cost, 76 - 230 grade crossings could be eliminated, ~~or~~ and/or roads and bridges could be repaired. Grade crossing elimination along Harlem Ave, 1st Ave, Cermak Rd, and Grand Ave would be beneficial to all road users. Freight traffic would have freedom of movement, and private vehicles and PACE/CTA buses would be much more reliable. The CREATE program is a great start, and adding more grade separations would improve the network for all users. 1

Suggested separations: - Grand/76th, Elmwood Park - Grand/Fullerton/Harlem, Elmwood Park - Harlem/26th, N Riverside - Harlem/34th, Riverside - Harlem/63rd, Summit - Cermak/1st, N Riverside - Lake/1st, Maywood - Grand/Thatcher, River Grove - Cermak/Cicero, Cicero - Cermak/Laranie, Cicero - Lake/5th, Maywood 2

1130 Ontario St. Apt. C7 Oak Park, IL 60302

MR. NUDELMAN: My name is Jason Nudelman.

So I heard the cost of the project is roughly $2.3 billion. I am currently a commuter on the 307 bus route on Harlem Avenue and that bus route has four train crossings that are at grade.

Now, I realize this project is very valuable for expanding capacity. But in terms of importance, I think a more immediate importance right now is separating some of these heavy, congested train crossings. And I understand the CREATE Program is doing that but I think more funding should be applied to that. 1

MR. HARMET: Thank you. I would say that the Eisenhower is one of many projects that needs to be accomplished in the region. And I would say also that the Eisenhower is still a very important project because of the role it plays with connecting communities to the region and vice versa.

So I know that certainly the 25th Avenue project that's almost finished with the grade separation and CREATE has done a lot of work in the region so far as that and that will continue. But at this point we really are just identifying what the scope of work would be for the Eisenhower, and we will have also have a conversation about funding. I think funding above everything, that continues.

HYPERLOOP IN THE CENTER OF THE EISENHOWER GOING EAST AND WEST! BUY THE MANNHEIM STRANGLER LAND NEXT TO CARMAX AND EXPAND THE PARKING LOT INTO A HUMANS, CARS & CARGO HYPERLOOP ABOVE THE STREETLIGHTS. IN BETWEEN THE STREETLIGHTS ALONG THE EISENHOWER BUILD BEAMS IN BETWEEN TO HOLD THE STUCTURE. YOU WILL ENTER AT MANNHEIM AND THE TOP OF THE OLD MAIN POST OFFICE WILL BE REDESIGNED TO LET PASSENGERS EXIT TO CONGRESS! THE HYPERSONIC TRAIN SYSTEM WILL BE A 30 SECOND RIDE COMPARED TO A 30 MIN-2 HOUR BUMPER TO BUMPER IDLE WASTING GASOLINE SO THE OIL COMPANIES CAN JACK UP A GALLON TO $5! HYPERLOOP! HYPERLOOP! HYPERLOOP! PRIMITIVE APES RUNNING CHICAGO! ARREST RAHM, RAUNER, MADIGAN & DURBIN & AND THE REST OF THE LOW LIVES MAKING ILLINOIS WORST STATE 3 YEARS IN A ROW AND #1 IN VIOLENCE MORE THAN LA & NY COMBINED!

UBER FLYING CAR TAXI'S AND GOOGLE MAPS WONKAVATOR'S WILL ALSO HELP CUT DOWN ON TRAFFIC BESIDES THE HYPERLOOP HYPERSONIC TRAIN GOING EAST AND WEST. UBER SHOULD BUY UP EVERY SINGLE FLYING CAR THATS 4 STARS FOR TAXI SERVICE. GOOGLE SHOULD CREATE PODS. ALMOST LIKE BUS STOP STATIONS. YOU ENTER THE WONKAVATOR AND TYPE IN YOUR GOOGLE MAPS DESTINATION AND IT WILL QUADROCOPTER YOU TO THE CLOSEST GOOGLE WONKAVATOR POD STATION TO THE DESTINATION YOU ENTERED. I THINK USA IS PRIMITIVE IN THEIR TRANSPORTATION. LAZY FAT FUCK POLITICIANS THAT TRULY DON'T CARE ABOUT OUR NATION. THE ATLANTIC AND PACIFIC IS FREE WATER TO TRANSPORT HUMANS! TAKE THE SALT WATER AND CREATE WATER COASTERS AND FLOAT HUMANS IN TUBES THROUGH CITIES?! WHY DOES CALIFORNIA NOT HAVE SPLASH MOUNTAIN WATER COASTERS NOT ONLY FOR TRANSPORTATION BUT TOURISM?! FLORIDA SHOULD BE #1 WITH THE ENGINEERS FROM DISNEY AND UNIVERSAL THEIR ENTIRE INFRASTRUCTURE SHOULD BE SHOOTING HUMANS IN WATER COASTERS AROUND THE CITY FUNNELING AS MUCH SALT WATER THROUGH THE TUBES. CHICAGO WATER COASTER WOULD NOT BE VIABLE BECAUSE OF THE MONTHS OF FROZEN TEMPERATURES BUT THE TEMPERATE CLIMATES IN CERTAIN EAST AND WEST COAST STATES SHOULD 100% USE THIS. COULD YOU IMAGINE HOPPING IN A JETSONIAN GLASS OR HARD PLASTIC ENCLOSED WATER POD AND FLOAT AROUND THE CITY. ERIC GARCETTI SHOULD BE MORE PROGRESSIVE ALONG WITH GOV RICK SCOTT. ANOTHER OPTION AS WELL ARE ANTHOLE UNDERGROUND HYPERLOOP IF CHICAGO DIDNT WANT TO BUILD ABOUT THE EISENHOWER. ELON MUSK WANTS TO DIG HIGHWAYS UNDERGROUND BUT EVEN THAT SEEMS PRIMITIVE. WHY NOT BUILD UNDERGROUND HYPERLOOP TUBES ALL OVER USA, MEXICO AND CANADA. AN ENTIRE HYPERSONIC TRAIN SYSTEM DEVELOPED ALL UNDER THE EARTH. ANYTHING BUT THE CTA AND 3 LANES AT MANNHEIM CONVERGING TO AN ETERNITY OF MISERABLE STRANGLING TRAFFIC UNTIL AUSTIN 4 LANES. HOW HUMILIATING RAHM HAS NOT BEEN MORE PROACTIVE REGARDING OUR TRANSPORTATION. CHINA IS CRUSHING US IN SPEED SO IS JAPAN AND EVEN RUSSIA. WE ARE LOSING USA! THIS IS A FACT! WE ARE BEHIND IN THE #1 CATEGORY FOR MORE FREE TIME AND AUTONOMY FOR HUMANITY! WHEN YOUR COMMUTE TIME IS CUT IN HALF TO WORK THAT LEAVES HALF THAT TIME DESIGNATED TO THE HUMAN'S DESIRES AND PASSIONS INSTEAD OF THE SLAVE, SERVANT, PEASANT & SERF LIFESTYLE THEY ARE FORCED INTO BECAUSE OF CAPITALISM! THANK YOU!

I THINK AN EXTRA LANE IS COMMON SENSE. 4 LANES THROUGHOUT MANNHEIM TO AUSTIN CONNECTING. MAYOR EMANUEL SHOULD HAVE FINISHED THAT IN HIS 1ST TERM! I THINK WE NEED TO CLEAN UP ALL THE EXITS WHEN YOU FIRST GET OFF THE HIGHWAYS ON THE EXIT RAMPS! THEY ARE SO BORING AND NOT KEPT UP WITH AT ALL! RAHM IS AN ART MAJOR! STEEL PIECES ON THE CORNERS TO REPRESENT THE TERRITORY! FLOWERS? PLANTS? LANDSCAPING OF ANY KIND? I THINK RAHM SHOULD LET KEIM BRICK STAINING MAKE THE MOST BEAUTIFUL MURALS ALONG THE EAST AND WEST EISENHOWER! PHILIPS COLOR KINETICS LED LIGHT STRIPS ALONG THE HIGHWAYS AND MORE CREATIVE UNIQUE DIGITAL BILLBOARDS! HOVER CARS ARE ANOTHER FORM OF TRASPORTATION TO AVOID EVER HAVING TO FILL MISERABLE SINK HOLE POT HOLES AFTER A HARSH WINTER SNOW AND SALT PLOWS TO THE STREETS. MAGNETIC STRIPS ON THE STREETS THAT HOVER AND GOOGLE MAPS CONTROLS THE TRACK SELF DRIVING HOVER PODS. LIKE WHAT GEORGE JETSON FLIES IN BUT DON'T ALLOW THEM TO HOVER MORE THAN A FEW FEET. LARRY AND SERGEY CAN ENGINEER AND FIGURE THAT ONE OUT ALONE WITH THE QUADROCOPTER WONKAVATORS! THE WONKAVATORS WOULD BE SO AMAZING TO WALK OUTSIDE YOUR HOME AND SEE HUMANS FLOATING IN A CLEAR POD TO THEIR DESTINATION OF CHOICE. MAYBE A MCDONALDS OASIS ABOVE LIKE HINSDALE OASIS? A NEW OASIS OF FOOD $ YELP FOODIE QSR'S INSTEAD OF STOPPING IN THE HOOD AT A CHURCH'S CHICKEN! TAKE ONE OF THE ABANDONED OVERPASSES AT AN EXIT WHERE A PARKING LOT AND GAS STATION CAN BE MADE ACCESSIBLE. MANNHEIM OASIS IS PERFECT WITH THE PARKING LOT NEXT TO CARMAX AVAILABLE. USE THAT LAND AND CREATE JOBS IN HILLSIDE WHICH IS SO LOW POVERTY AROUND THERE AND LAND JUST WAITING TO BE PENETRATED! THE MANNHEIM OASIS WILL BE BUILT RIGHT THERE I CAN SEE IT NOW! FOR ALL THE SEMI TRUCKS BEFORE THEY GET ON 294! CREATE JOBS FOR CHRIST'S SAKES!

LETS ADD A TOLL AT THE MANNHEIM OASIS! MORE TOLL $! ADD ONE TO 83 NORTH AND SOUTH AND 53 NORTH AND SOUTH THE PASS ROADS TOLL FREE! MAKE AS MUCH $$$ AS YOU CAN OFF THESE PEASANT, SERVANT, SERF AND SLAVES OF ILLINOIS. THE TOLLS WILL PAY TO BUILD OUT THE MANNHEIM OASIS ALONG WITH STARBUCKS, DUNKIN DONUTS/BASKIN ROBBINS. MCDONALDS, SUBWAY, CHICK FIL A, PANERA, CHIPOTLE, BLAZE FIRE PIZZA, PORTILLO'S, GLAZED, INFUSED! THE TRUCK DRIVERS SHOULD FILL UP GAS BEFORE THEIR HAUL TO INDIANA AND ENJOY THE BEST RATED QSR FOR ANTIBIOTICS IN THEIR MEAT A,B, C RATED. I THINK THAT WOULD BE REALLY NICE FOR CHICAGO AND TOURISTS. 1

I THINK THE OLD MAIN POST OFFICE UPDATE IS FANTASTIC FOR CHICAGO. WHAT AN EYESORE TO DRIVE INTO AN $8 BILLION DOLLAR TIF FUNDED CITY OF 3 MILLION AND SEE THAT BLINDING SIGHT! UGHHHH A WAVE OF INTUITIVE REPULSION! 2

CHICAGO BEARS have the opportunity to become number 1 franchise in all of American sports surpassing Jerry Jones and the Dallas Cowboys franchise. The Green Bay Packers are the only community owned athletics franchise in American professional sports. Currently as it stands the Chicago Bears are No. 8 with a current value of $2.45 billion dollars. In 2014 their revenue was $352 million dollars with an operating income of $86 million. Green Bay Packers are No. 10 NFL franchise with a current value at $1.95 billion dollars. Their revenue was at $347 million in 2014. Also in 2014 their operating income was $63 million dollars. There are only 104,779 citizens currently living in Green Bay, Wisconsin versus Chicago, the third largest city in the nation at 2.719 million citizens to support our cities team franchise. Rather than being the property of an individual, partnership or corporate entity, they are held in 2014 by 360,584 stockholders. No one is allowed to hold more than 200,000 shares; approximately 4% of the 5,011,557 shares currently outstanding. It is the broad-based community support and non profit structure which has kept the team in Green Bay for nearly a century in spite of being the smallest market in all of North America. With Los Angeles stealing the St. Louis fans market the Ram's fans are looking for a new team to attach their loyalty and more importantly their cash and credit cards too! The Lucas Museum cost the city of Chicago $743 million dollars and billions in tourist revenue for our city. I would like to turn this tragedy into opportunity and speak to FOTP about utilizing the landscape to build an additional viewing only stadium for Bears games in place of a "PARKING LOT." If Friends of the Park want a % to build their parks they will receive the demands George Lucas would not meet for the Star Wars museum. If the Chicago Bears organization decides to go public I suggest they offer initially $1.6 billion dollars in shares with NO LIMIT to how many shares you can hold. First come first serve. The revenue we will receive 3

along with the McCaskey's staying majority owners purchasing $2.45 billion in shares can create thousands of real jobs for the Southside of Chicago and Near South region. With UIC Roosevelt and Near South having almost $1.5 billion in TIF funding this stadium will only add to the booming Chicago areas and the multiple high rises still being built. With an ever growing city of Chicago we must feed our citizens. Imagine a stadium with every edible desire and craving you can ever have is all in one spot. Imagine visiting every NFL stadiums top concession on one concourse level. Imagine the Taste of Chicago gluttony and madness every home game. The city of Chicago will greatly benefit from this new venue with a sense of pride and tradition. This venue will be a 30,000 capacity $20-$30 viewing stadium and 24 hour fresh foods market similar to a Reading Terminal Market in Philadelphia, Pa. I suggest we take Bob Iger, the CEO of Disney, and his beautiful neo futuristic LA Stadium that was denied by Roger Goodell. Structurally we will build a skywalk with a walking escalator that will connect to the Southwest corner of the stadium. Your ticket will scan you into Soldier field, Barracks Stadium or both. All soldier field ticket holders will have access to both stadiums. We will take the upper deck level of the proposed LA stadium off and two levels will have a different array for a 24 hour food market. One level will showcase the 32 NFL team's top 3 best of the best concessions fan voted. The other level will have all 4 & 5 star Yelp restaurants and pop ups from all 195 countries. Once the $1.6 billion shares sell out which they will the McCaskey's will receive an extra $500 million to their personal net wealth and the $1.1 billion will go towards Soldier Field updates. The Chicago Bears are one of only 6 teams that do not sponsor its stadium. To raise extra funds Barracks Stadium can also have a Corporate Sponsorship attached perhaps a non profit organization like United Way or Salvation Army. CHICAGO BEARS will not only collect revenue off of Bears Games and concessions but will also have constant streaming venue in their 24 hour fresh foods market. Barracks Stadium will host sporting events, live nation concerts, musicians, plays and more. The 24 hour fresh food markets will have the Soldier field suppliers fund this food source along with Sysco, Marano foods, Greco foods and more purveyors. These food suppliers will give us products from all 195 countries for all citizens of the Republic to enjoy their cultural traditions from the lands they once occupied and called home. America is now home for all of us but traditions and customs specifically when it comes to food and drink can unite a city in brotherly love. The entertainment of football along with the desire for alcohol and food is what brings in the crowds year after year to support the Bears. With the Bears being the smallest stadium in the NFL at 65,000 capacity it will not turn into the number 1 at 95,000 beating AT&T stadium in Dallas by over 10,000 fans. When a touchdown is scored and points are on the board you will hear the roar from the Barracks outside where our Chicago soldiers will be stationed enjoying the victory. We will build a new parking structure to make up for the lost parking lot for fans and tailgating. We will set up a user friendly in and out common sense no traffic flow out of the Near South area. This will allow an amazing tailgate experience for our loyal fans that enjoy setting up a tent, grill and cooler and partying hours before the show. CHICAGO BEARS is looking to raise $1.6 billion dollars through public shareholders. Listed below are line items that the investor's investment will be dedicated towards. • $500 million for the McCaskey's• $500 million into Barracks Stadium• $500 million to pay out shareholders• $100 million Soldier Field Updates and add ons We plan on reinvesting 60-70% of all profits back into the company in order to ensure growth of the company on a yearly basis. The remaining 30-40% will be dedicated towards investor payouts.

I THINK IT IS COMMON SENSE THAT IF LA IS GOING TO IMPROVE THEIR HIGHWAYS WITH ELON MUSK THAN CHICAGO 290 SHOULD DIG BATMAN TUNNELS AS WELL MANNHEIM TO CONGRESS INTO LOWER WACKER DRIVE! ELON MUSK WE WILL PUT A TOLL TO SUPPORT THE PROJECT AT MANNHEIM AND WE WILL TAKE THE OHARE OASIS IDENTICAL MODEL FOR TRUCKERS BEFORE 294 AND ANYONE NOT FROM CHICAGO TO HAVE AN ILLUMINATED LIT UP OASIS SAFE ZONE WEATHER EMERGENCIES AS WELL. WE WILL BEGIN DIGGING UNDERGROUND BEFORE LA BECAUSE CHICAGO IS MORE ORIGINAL GANGSTER THAN LA. WHEN I BECOME MAYOR IN 2019 I WILL MAKE IT A PRIORITY FOR ALL 3 MILLION + CHICAGOANS TO HAVE A TESLA AND SPACE X ENGINEERED UNDERGROUND PASS ROAD TO OUR MAGNIFICENT ARCHIECTURAL GRANDMASTER PIECE! ELON MUSK IS IN NEGOTIATION WITH RAHM EMANUEL AS OF TODAY RIGHT NOW! WE CAN EVEN CARPENTER ANT DIG A PASS ROAD TO LAKE STREET UNDERGROUND! POWER CONSTRUCTION AND WALSH LEADING THE WAY ALONG WITH EVERY OTHER TOP CONSTRUCTION TEAM IN ILLINOIS AND WE CAN REVOLUTIONIZE TRANSPORTATION OF HUMANS FOR CENTURIES TO COME. LESS GASOLINE WASTED. LESS ENGINES SITTING IN IDLE. LESS OIL AND EMISSIONS! NO SPEED LIMIT! GO AS FAST AS YOU WANT NO TRAFFIC!

I think this project is a great opportunity to continue a collaboration with the renovation of the CTA Blue Line so that the two projects are well-integrated. Transportation is now more than just driving but it is also: biking, walking and taking public transit and as much as these can all be enhanced, the better. 1

There is also an opportunity to make the Eisenhower Expressway project as green as possible. We worked with IDOT to have green offsets for all of the concrete and asphalt and pollution from driving that will be involved with the Jane Byrne Interchange project. That IDOT public process and green offsets have gone very well. As many trees as can be planted on IDOT property as well as nearby City of Chicago and other State property, will go a long way to not only making the Eisenhower Expressway project more calming and aesthetically-pleasing but help capture a lot of the carbon and pollutants put into the air. Thank you. 2

PS2#1612

MR. ORZEL: My name is Ron Orzel. I'm at 834 South Clinton in Oak Park.

First of all, I think that changing the four free lanes to three free lanes and a HOV lane east of Austin is going to have a very negative public relations impact on the whole project. I think people are going to see it as another way that the government is trying to take money from them and create a toll situation on a free expressway and it will actually reduce the number of free lanes you can drive in. 1

Second of all, as someone who lives at 834 South Clinton, I am very concerned about whether or not I'm going to be able to sleep for two or three years while construction is going on, and I'm worried about damage to my property from the vibrations of the construction and I don't think that that has been addressed properly. 2

Finally, I sincerely hope that we don't have walls, at least in Oak Park. But the situation now where there are walls some places and walls not looks ridiculous. So I hope there's a decision one way or the other, although I would prefer not to have walls at least in Oak Park because you are splitting Oak Park into two sections. 3

Thank you.

Comments on Environmental Justice and Equity Relating to the Draft Environmental Impact Statement, of the I-290 Planning Process

William Peterman[1]
Professor of Geography Emeritus

I have reviewed the Draft Environmental Impact Statement released for public comment on December 30, 2016. My comments will focus on two sections of the Statement, S.5 – Environmental Resources, Impacts, and Mitigation and Appendix D – Environmental Justice Methodology Technical Memorandum. Based on my analysis, I conclude that **while the Draft EIS has complied with Executive Order 12898 it fails to consider the broader issue of environmental equity by not offering an option for more extensive public transportation in the I-290 corridor.** 1

The two sections of the Draft EIS, S.5 and Appendix D relate to Executive Order 12898 of February 11, 1984 and address the issue of environmental justice in minority populations and low-income populations. The data, the analysis, and the discussion are thorough and complete with respect to the Executive Order. I find no problems with the analysis and agree with the conclusion of no disproportionately high and adverse human health or environmental effects of the proposed reconstruction of I-290 on minority and low-income populations. That is, both minority and low-income populations will not suffer from the impacts of construction and from the reconfigured expressway any more than the general population. However, this finding is quite narrow, addressing only the issues covered in Executive Order 12898. 2

Since this order was issued in 1984 much work has been done exploring how minority and low-income populations are disproportionately impacted by transportation policies and actions resulting from them. Specifically, what is meant by environmental justice has been expanded to include the notion of environmental equity. According to researchers at the Civil Rights Project at Harvard University[2], an equitable transportation system should, among other things:

- Distribute the benefits and burdens from transportation projects equally across all income levels and communities;
- Provide high quality services – emphasizing access to economic opportunity and basic mobility – to all communities, but with an emphasis on transit dependent populations; and
- Equally prioritize efforts both to revitalize poor and minority communities and to expand transportation infrastructure.[3]

3

Neither the Draft EIS nor any of the proposed alternatives for I-290 address these points. There has been a failure on the part of the planners to address all aspects of environmental justice, especially to relating to equity. In the end should I-290 be reconstructed the existing transportation inequities will continue to exist.

[1] Mailing address: 747 South Cuyler Avenue, Oak Park, IL 60304.
[2] Sanchez, Thomas W., Rich Stolz and Jacinta S. Ma (2003). Moving to Equity: Addressing Inequitable Effects of Transportation Policies on Minorities. Cambridge, MA: The Civil Rights Project at Harvard University.
[3] Sanchez, Thomas W. and Marc Brenman (2008). The Right to Transportation. Planning (January). Chicago, IL: American Planning Association.

My conclusion that the proposed I-290 project does nothing to address the issue of an inequitable transportation system is based on my determination of how many households in the minority and low-income populations located just to the north and south of I-290 would not receive any benefits from the proposed alternatives. I do this by using the most recently available data from the American Community Survey (U.S. Census) both in its raw form and as summarized by several different organizations in the Chicago area. Specifically I identified the percentage of households lacking direct access to an automobile.

The data show the percentage of households lacking access to an auto in the eighteen Chicago census tracts extending eastward from Austin Boulevard and adjacent to I-290 ranges from 21% (tract 2605) to 55% (tract 8430). The average percentage of households without an auto for the 18 census tracts is 36.7%[4]. By contrast, the percentage of households lacking access to an auto in the communities along I-290 and west of the city of Chicago is 13% in Oak Park, 10% in Cicero, and 11% in Berwyn. 4

Households in areas of the west side of Chicago adjacent to I-290 disproportionately lack access to autos for traveling to work, shopping, or pleasure. The proposed changes to I-290 will do little to address this inequity, since public transportation is only tangentially addressed. It does little good for a household without a car for automobile transportation times and levels of congestion to be slightly reduced. As jobs, retail opportunities and sources for recreation are increasingly found in the suburbs, a more equitable transportation policy would be one that while maintaining auto accessibility would also improve public transportation. Suggested improvements of the CTA Blue Line associated with this project are quite modest and do little to address the inequities.

I am aware of the limits of the Draft EIS and of the present priorities of the CTA that do not favor the extension of the Blue Line, but would like to suggest that the immense expenditures to be spent and the significant disruptions associated with the I-290 project that will result in only modest improvements in travel time and congestion, is a poor policy choice. A much more appropriate transportation strategy and one that would address existing environmental inequities for minorities and low-income populations of Chicago's west side would be to shift from road building to improving and extending rail rapid transit (CTA)[5]. 5

[4] The percentage of households lacking auto access in these west side census tracts is significantly higher than the percentage of households in all of Chicago, which is 27%.

[5] Other benefits of such a policy shift would be a reduction of greenhouse gases and movement towards a more sustainable environment.

PS2#1614

Randolph Rankin

816 Lyman Ave. Oak Park, IL

MR. RANKIN: My name is Randolph Rankin.

I'm a homeowner in Oak Park near Austin Boulevard. I don't have a driver's license. To get around, I use my senior citizen $50 pass and use the Blue Line all the time.

I just have several comments that I would like to just put on the record, and I will fill out the forms as well. But I did have a couple ideas that I liked a lot of what I saw.

I'm delighted with the redesign of the Austin station, which I use personally every day more than once.

My first kind of question/comment is the one thing that disappoints me the most is there is no rail extension of the Blue Line past the Forest station stop. And my kind of comment is that I see the CTA is doing some wonderful things downtown with the new bus stops. In fact, they are designing bus stops that almost look like stations. So rather than just reserve a corridor or some grass for a future, future Blue Line extension, why not build a real bus route where people would get off the Blue Line at the Forest, Forest station stop, and transfer to an express bus that would simulate what a train could be in the future. And this shouldn't just stop where the current right-of-way is indicated, but there is no reason why it couldn't curve up to O'Hare or curve down to the south side as well so it could create kind of a beltway or a loop around Chicago. 1

The thing that fascinated me most, I heard the comment that the original Eisenhower was multimodal and was the first of a kind, a real innovation. So we should try to innovate, too. So this idea of a rail, of a bus, an express bus extension, simulating, would be a real innovation. And I will put the rest of my comments on paper.

MR. HARMET: One of the things we are proposing is that there would be an express bus coming from the Forest Park station going west and the bus would ride in that managed lane. So the managed lane is structured so that there would be a 45-mile-an-hour operating speed minimum. So it would act like an express, and go certainly beyond the study area. So we have been working with that concept for the preferred alternative.

MS. FARZIN: I will comment as well, the question of a CTA rail line extension has come up several times during this project. For us we had limited funds in the Vision Study. And the most important aspect of the CTA is to maintain the existing infrastructure. It's both irresponsible, and we couldn't seek federal funds for an extension without maintaining the existing -- You know, if you have a house and your roof is leaking, it's not a good time to put on an extension. So really the focus of this study first was to look at the existing infrastructure. And once we get that under control, we will continue to look at opportunities systemwide where there may be opportunities for extension.

COMMENTS by Ranolph (Randy) Rankin (homeowner and long time OP resident) 816 S Lyman Ave Oak Park
(I am posting this on line via eisenhowerexpressway.com on 2/12/17. I will also mail a hardopy on 2/13/17)

1) New INFILL station in Oak Park - The CTA should research the value of creating an an additional Blue Line station for Ridgeland Ave (6400 west) More and more young residents of Oak Park are traveling to UIC, med center, downtown Chi etc for work and study. This new station could "hug" Ridgeland - otherwise it could also run from Ridgeland to East - and the existing Oak Park station might run WEST from OP ave instead of east? 1

2) UNNECESSARY DELAYS- Blue Line trains are often delayed because they must wait for signal clearance or an available track inForest Park station. The Green line has the same problem as an end point on that line - trains sit and can't discharge passengers at Harlem. The delays can be VERY lenghty - just they are at OHare sometimes. Because of these delays blue line rider miss bus connections at Forest Park 2

3) "RAPID BUS" / INNOVATIVE MULTIMODAL DESIGN / METRO CHICAGO PUBLIC TRANSIT BELTWAY + CORRIDOR - Cities like Atlanta are realizing the high value of new bus "corridors" CTA should build a series of "stations" for its express bus service running west from Forest Park complex and this service should fan out in myultiple directions (like Green line in Boston), including all the way to Ohare. The new "stations" could resemble downtown LINK raised platform design. IMPORTANT - people disembarking the Blue line train at FP must be able to effortlesly and quickly walk across the platform and board an express bus. (they should not even have to go upstairs) Express bus schedules would dovetail with blue line train schedules. An incoming "bus" is greeted by a waiting train " The bus stops should resemble train platforms. This encourages future businesses to begin to grow up around and "hug" the new bus corridtor emerge hugging the improved express bus service fo a strange of important suburbs west of Forest Park - This tranist corridor will simulate what a rail line might someday look like 3

4) MAKE EISENHOWER AN ECONOMIC CORRIDOR The biggest single problem with this design IMHO is its failure to enourage commercial/business development near many of the station entrances. The dead areas around the Austin Blvd entrance are a good example - an exellent solution would be to build a mid sized multistory hotel and parking structure to replace the Village parking lot now just north of expy across from Columbus park Proposals should be solicited from developers. Space should be reserved on ground floor of the new hotel for various types of businesses such as small grocery stores/supermarket. Make room for a neighborhood Walmart for example Another idea - build a small movie theater complex at Harlem near the expressway - again that whole area is DEAD and unwelcoming and urgently needs to be transformed in a catalyst for economic growth and jobs 4

5) REVOLUTIONary IMPACT OF MOBILE PHONES ON PUBLIC TRANSIT Uber cars and Uber competitors are already picking up and discharging passengers at Austin Blvd station entrance. Design should be friendly to such services There should be areas near many of the stations for ad hoc staging of car pools by drivers - and for Uber and other services - and some of these new services will doubtless in several years include driverless for hire vehilds by individuals or small groups 5

6) BUSES OF THE FUTURE CTA city and Pace bus will likely be driverless by the time new expway is finished - and likely downsized for more frequent flexible service. We need lots of places all along the length of the redesigned expressway for this new fleet of buses to pick up and discharge riders 6

7) TRAINS OF THE FUTURE Have shorter Blue line trains (fewer cars) but more FrEQUENT Trains. METRA is a good example of problem - trains running with many empty seats - short the trains but add MANY addl trains to the schedule 7

8) Instead of having just 4 lanes on expressway (one lane with toll) - would there be room for 5 lanes in both directions?? 8

9) LEVERAGE VALUE OF TODAY"S BLUE LINE Effective immediately the Austin 91 bus should be extended to Cermak - it makes no sense to terminate service at Roosevelt - a slightly longer route will act as a feeder from the south for increased ridership to Blue Line . We need to maximize the existing blue line infrastructure. 9

10) SPIFF UP WHAT WE HAVE NOW - Effectively immediately a simple low cost ongoing program should be insttituted to better maintain greenway on sides of expressway - garbage has been accumulating for many years - grass is all weeds - never cut. 10

11) DONT MAKE STATIONS ON WESTERN END OF BLUE LINE INFERIOR TO STATIONS CLOSER TO DOWNTOWN The design of the Austin station should resemble the new Halsted station - riders should leave the station entrance and be able to walk across austin to catch a northbound station. Consider having canopy over this area to protect riders 11

12) EFFECTIVELY IMMEDIATELY Seamlessly integrate PACE and CTA bus networks - avoid dead ends and overalp of services. Having two networks is EXTREMELY wassteful - and bus service can be revolutionized for very little capital expenditure 12

I am concerned about the impact of construction on my home that is close to the Eisenhower. I am requesting that homeowner concerns are taken into consideration on the potential impact to my foundation. 1 I am also concerned about the noise from the project, the noise from hellicopters and I am wondering if there are ways to limit the news hellicopters. 2 I am also concerned about the increased air polution due to the increased number of cars. 3 I also would like IDOT to increase the size of the East ave bridge. 4 I am wondering where the staging of materials will be and hope it is on the expressway itself instead of in the neighborhoods.

Public Hearing

Illinois Department of Transportation

Please select date: ☑ ***January 25, 2017*** ☐ ***January 26, 2017*** ☐ ***I was unable to attend***

The Illinois Department of Transportation (IDOT) is holding public hearings on the Eisenhower Expressway Draft Environmental Impact Statement (DEIS), which is evaluating transportation improvements on Interstate 290 in Cook County, Illinois. The DEIS evaluates the section of Interstate 290 from west of Mannheim Road to Racine Avenue. The DEIS is a compilation of stakeholder outreach and comprehensive information about the project's purpose and need, alternatives under consideration, the preferred alternative, social, economic, and environmental effects and proposed mitigation strategies, and potential effects on future traffic operations. The findings of the CTA's Blue Line Vision Study will also be presented.

Public comments will be accepted through Monday, February 13, 2017. Please place your comment forms in the box marked COMMENTS; **or** fold in thirds, tape closed, place a stamp and mail; **or** fax to (847) 705-4159. Comments can also be submitted on the project website at www.EisenhowerExpressway.com.

The public is encouraged to review and comment on the:

- **Project's purpose and need for the improvement**
- **Alternatives under consideration**
- **Preferred Alternative**
- **Preliminary road closure plan for Harrison Street and Bataan Drive at 1st Avenue**
- **Social, economic, and environmental effects and proposed mitigation strategies**
- **Proposed Section 4(f) *de minimis* impacts for improvements at public parks (Veterans Park, the Dog Park, and the proposed Recreation Center site along Circle Avenue) in the Village of Forest Park**

The +3 lanes will NEVER work what is needed is a dedicated express lane(s) with limited access and definate barriers seperating local and express lanes- Who will enforce? 1

The Harlem overpass will not solve the problem of Semi trucks entering and exiting the Eisenhower. They consistantly snarl traffic on Harlem 2

Access lanes from Harlem to Eisenhower to short, causing congestion on Harlem, both N bound and S. bound. 3

This project is wasting money. The Hillside Strangler project helped very little for what it cost. Maywood needs funding for after school programs. We just lost Aldi's, we're losing businesses in Maywood. Half the houses are in or about to be in foreclosure. So many other things need to be funded. I don't know how this project got this far. I have voting no to this project and so have many people I have talked to.

This is simply a porkbelly bill, wasting tax dollars!!

Currently, the Sight Lines at Lombard Bridge at Garfield and Lombard are obstructed by concrete walls combined with the sharp angle of the bridge merging into Garfield. Drivers make wide turns because of the lack of good Site Lines. The bridge acts as a walk way for Irving Elementary School children from their homes to school; the area is located by a park and community center with children drop off areas; and the Lombard CTA access point is located here. Since the bridge is IDOTs responsibility wrt building and design, the site lines and pedestrian traffic (specifically for small children) needs to be improved. Additionally, a Divvy bike station is located here. Many bicycles cross at this bridge (since Ridgeland is a very busy street). Children ride their bikes over this bridge to their school friends located on the other side of the highway and to baseball and soccer games that occur at Barrie Park. A bike lane should be added to this bridge to assist with cyclist safety. Please note I know individuals who have been hit by cars multiple times at this intersection. It is not currently safe and the design needs to greatly improved. Please consider adding speed tables or rumble strips prior to pedestrian walk ways to decrease driver speed. 1

I am a long-time resident of Oak Park, a former Village Trustee, and a member of the Historic Preservation Commission. I am profoundly concerned about the plan for the Eisenhower Expressway, for the way construction would impact and have an effect on at least two local landmark buildings and perhaps many other structures. Both the Oak Park Conservatory and the Maze Library, the two landmarks, can suffer damage from the vibrations of the construction, in a way similar to the damage to the building at UIC that is next to the north side of the Expressway near the Byrne interchange. I am asking that you consider alternatives of mass transit instead of this massive, disruptive, costly, and potentially damaging construction project.Sincerely,David M. I would like to propose allowing motorcycles into the HOT lane and consider them Carpooling 3+ vehicles. Motorcycles get much higher mpg than vehicles and help minimize congestion. If more cars switched to motorcycles the congestion would decrease 1

Joan Suchomel

736 S. Taylor, Oak Park, IL 60304

MS. SUCHOMEL: Joan Suchomel. I live at 736 South Taylor in Oak Park.

I have two questions. And the first question is with adding a lane in both directions, what have you done around the concept of induced demand and how long do you think this is going to be before the latest starts to slip down again in the future? 1

And why is the HOT toll lane better than a free lane in your estimation? 2

MR. HARMET: We did look at the idea of induced demand by coming in with a build, developing a build and no-build forecast.

Really the key issue on an urban project like this is there isn't any urban sprawl. It's already urban. So what you would see is redevelopment of existing land uses. And there is then not a lot of generators of new trips and so forth. We think that, well, based on the analysis, about 10 percent increase in traffic between, on average, build and no build. So we have accounted for that. Because that's what also drives the environmental analysis is that build forecast.

The HOT lane, what that does overall is provides the best balance of arterial relief and improve mobility on the Eisenhower.

We also went through safety analyses and so forth. But the difference between the HOT lane and the general purpose, just plain-old unrestricted lane, is that there is enough travel on the Eisenhower already that with just a plain, old regular lane, we would not be able to provide that predictable, reliable trip.

With a managed lane and structuring the toll rates, we would have a 45-mile-an-hour trip on that inside lane. So that's the major difference, we are providing something predictable that we wouldn't necessarily be able to do with a general purpose lane.

1 Infrastructure improvements are greatly needed on this corridor. The interchanges are greatly outdated and unsafe. Additionally, the whole area is an eye sore. and needs more greenspace, landscaping, etc.

2 Obviously the State of IL needs to examine alternative funding measures for transportation. Tolling and gas taxes are the perfect mechanism as they are essentially applying a "user fee". IDOT & the State Legislature need to examine and pass legislation that would allow use of Public/Private Partnerships, use of Design/Build construction and allow for tolling of the interstate system. These mechanisms are already working well in other states and with Illinois' fiscal issues, that state needs to be proactive and not reactive to these alternative funding solutions.

Monica Thomas

1644 S. 16th Ave. Maywood, IL

MS. THOMAS: Monica Thomas. I live here in Maywood.

I may have missed this, I apologize for coming in late. Last time you were here, you stated there was a question regarding the wall that would go along Harrison Street. Do you have a results on that? Are you still working on that?

And then also, too, I understand in your brochure you state that phase 2 and beyond is not funded.

And we do have a new administration in Washington. What are the chances of it getting funded? 1

MR. HARMET: Well, I can't speculate on exactly what would happen. But we are going to develop a financial plan and look at various funding mechanisms. And if there is a new transportation program in Washington, we are certainly going to look and see how the Eisenhower project would fit.

MS. THOMAS: So that would be after the summer, after this phase, this is what, 2017, then you would go to Washington to make the, try to get the appropriations? 2

MR. HARMET: Well, we would start off with a final analysis here. And we would also be observing what transpires in Washington because there is an outline of a plan and a lot of conversation about transportation funding. But until it's put together in a specific program, we won't know exactly how the Eisenhower fits with that potential future funding.

Encouraging the expansion of automobile traffic in the 21st century without expanding, enhancing and promoting public transportation is to be on the completely wrong side of history. Younger people are eschewing automobile ownership more and more as well they should be. In many years of observation while riding the Blue Line from Oak Park to downtown, there are very few cars with two commuters let alone three. Not only that but no one at the last meeting had ANY idea how enforcing the three-person rule was going to be done. Barbara Vanek Oak Park

Please, please, please, please, please do NOT put up sound walls through Oak Park! We already have sound barriers because the expressway is several feet below the surface! Transient apartment dwellers who do not own residential property, but are closest to the expressway, should NOT have been the people given the vote. Thank you!! 1

PS2#1597

Sonja Williams

1018 31st Ave. Bellwood, IL

MS. WILLIAMS: Sonja Williams, 1447th Avenue in Bellwood.

My question is how will some of the local communities be impacted financially with some of these changes that improve everything else. Some of this money I suppose is from federal dollars, but what about some of the other money that you will need? 1

MR. HARMET: Typically, traditionally an interstate project like this would be 80, 90 percent federal funding. There are local costs depending on the scope of work in each community, for example, traffic signal. 80 percent of that cost is state or federal. And then the other 20 percent is split up depending on whether a village or the state has jurisdiction over one of them, so you could be involved in 5 or 10 percent of the traffic signal costs.

Those are things we are going to be working on with the communities. We are going to put together what's called a Letter of Intent that spells out the scope of work items, as well as the local cost for participation on there, and that is something each community will need to discuss further.

But one of the things we do need to do is work on a financial plan and kind of outline the big picture. So we wouldn't, by the end of this planning period, we will know some things about specific local cost participation. But so far as financing the overall project, we have more work to do on that.

driving, which is not clearly addressed by the plan. No one should be comfortable with the plan as it is. It's outrageously expense, prolonged, and will not solve all the problems as we continue to move forward with westward expansion of Chicago. Thank you.
